

Appendix 1. Geophysical Logs and Hydrogeologic Characteristics for Selected Wells at Aquifer Storage and Recovery Sites in Southern Florida

This appendix provides borehole data and hydrogeologic interpretation for selected aquifer storage and recovery (ASR) wells in southern Florida. Geophysical log traces, a generalized lithologic column, preferential flow zones, geologic and hydrogeologic units, constructed open-hole interval(s), and vertical changes in ambient chloride concentration, as indicated by water samples collected from known intervals, are illustrated in plots for at least one well per site. The geophysical log traces have been grouped and plotted in four tracks where available. From left to right, these borehole log curves include: track 1—gamma ray, caliper, and spontaneous potential; track 2—formation resistivity; track 3—formation porosity (sonic, neutron, and density logs) and some borehole fluid temperature; and track 4—borehole fluid (temperature, resistivity, and fluid velocity or flowmeter). A list of the geophysical logging tool devices and units used in these plots is given in table A1. Most geophysical log data can be obtained from the DBHYDRO database web site, http://glades.sfwmd.gov/pls/dbhydro_pro_plsql/show_dbkey_info.main_page, which was developed and operated by South Florida Water Management District (SFWMD). Hard copies of logs were digitized by the SFWMD for this study, and the data were stored in their database.

Data from monitoring wells often were used instead of injection wells because monitoring wells generally were the first (test) wells at a site and were drilled to greater depths. Where monitoring well data are used, the ASR storage open-hole interval for the injection well at the site also is shown or indicated. At one site (site 9), only a test well has been drilled

and has not yet been completed. Two of the facilities (sites 11 and 13) are at the same location, and only one plot (well L-5817, site 13) is used for both. At site 12, plots of both the ASR well and a monitoring well are included.

The geologic and hydrogeologic unit boundaries shown on the plots in this appendix are listed together with their sources of determination in tables A2 and A3. The lithologic descriptions used to illustrate lithology in the lithologic column were obtained from well completion reports written by consulting firms for the individual ASR sites or from the Florida Geological Survey (Florida Geological Survey, 2004).

Flow zones were determined primarily using the borehole fluid curves including the flowmeter, but other curves such as the caliper, resistivity, and porosity logs can provide supporting data. The sources of determination for the flow zones are given in table A4. Borehole fluid logs, however, often were not run above where the final casing was set at the top of the open interval, which sometimes was below the top of the Upper Floridan aquifer. The determination of the top of the aquifer was less certain for these cases (for example, sites 2, 3, and 4).

Wells at most sites penetrated only the Upper Floridan aquifer; at some sites, however, deep aquifers were penetrated. Both the middle Floridan aquifer and the upper part of the Lower Floridan aquifer were penetrated at five of the sites (9, 16, 21, 22, and 26), and in this appendix, a second page is included that shows these deeper aquifers. Additionally, at two other sites (25 and 28), the middle Floridan aquifer was penetrated.

Table A1. Geophysical logging tool devices and units used in appendix 1 plots.

[In many wells, more than one log run is shown. In most cases, these runs were spliced together at the bottom of the upper run and are labeled “(spliced)” in the heading]

Logging tools and devices		Units	
Abbreviation	Description	Abbreviation	Description
AHO10	Array induction – 1-foot resistivity A10	OHMM	Ohm-meters
AHO60	Array induction – 1-foot resistivity A60	OHMM	Ohm-meters
AHO90	Array induction – 1-foot resistivity A90	OHMM	Ohm-meters
CAL	Caliper	INCHES	Inches
DPHI	Density porosity (compensated)	PU	Porosity units as a percent
DT	Delta T – Sonic log traveltime (compensated)	USEC/FT	Microseconds per foot
DTEM	Temperature differential or gradient of borehole fluid	DEGF/FT	Degrees Fahrenheit per foot
DYND	Flowmeter (trolling down) – Pumped or flowing	CPS	Counts per second
DYND	Flowmeter (trolling down) – Pumped or flowing	RPM	Revolutions per minute
DYNU	Flowmeter (trolling up) – Pumped or flowing	CPS	Counts per second
FRES	Fluid resistivity (flow conditions unspecified)	OHMM	Ohm-meters
FSD	Flowmeter (trolling down) – static	CPS	Counts per second
GAMM	Gamma Ray	CPS	Counts per second
GR	Gamma Ray	GAPI	American Petroleum Institute standard units
ILD	Induction log deep	OHMM	Ohm-meters
ILM	Induction log medium	OHMM	Ohm-meters
LAT6	Lateral log (AO electrode spacing = 6 feet)	OHMM	Ohm-meters
LL3	Laterolog 3 (shallow focused resistivity run on induction tool)	OHMM	Ohm-meters
NEU	Neutron	CPS	Counts per second
NPHI	Neutron porosity (compensated)	PU	Porosity units as a percent
RLN	Resistivity (long normal) AM electrode spacing = 64 inches	OHMM	Ohm-meters
RSN	Resistivity (short normal) AM electrode spacing = 16 inches	OHMM	Ohm-meters
SP	Spontaneous potential	MV	Millivolts
TEMP	Temperature of borehole fluid (flow conditions unspecified)	DEGF	Degrees Fahrenheit
XCAL and YCAL	X- and Y calipers (two calipers run on same tool 90 degrees apart)	INCHES	Inches

EXPLANATION

tests, and samples collected
during reverse-air rotary drilling

FLOW ZONE

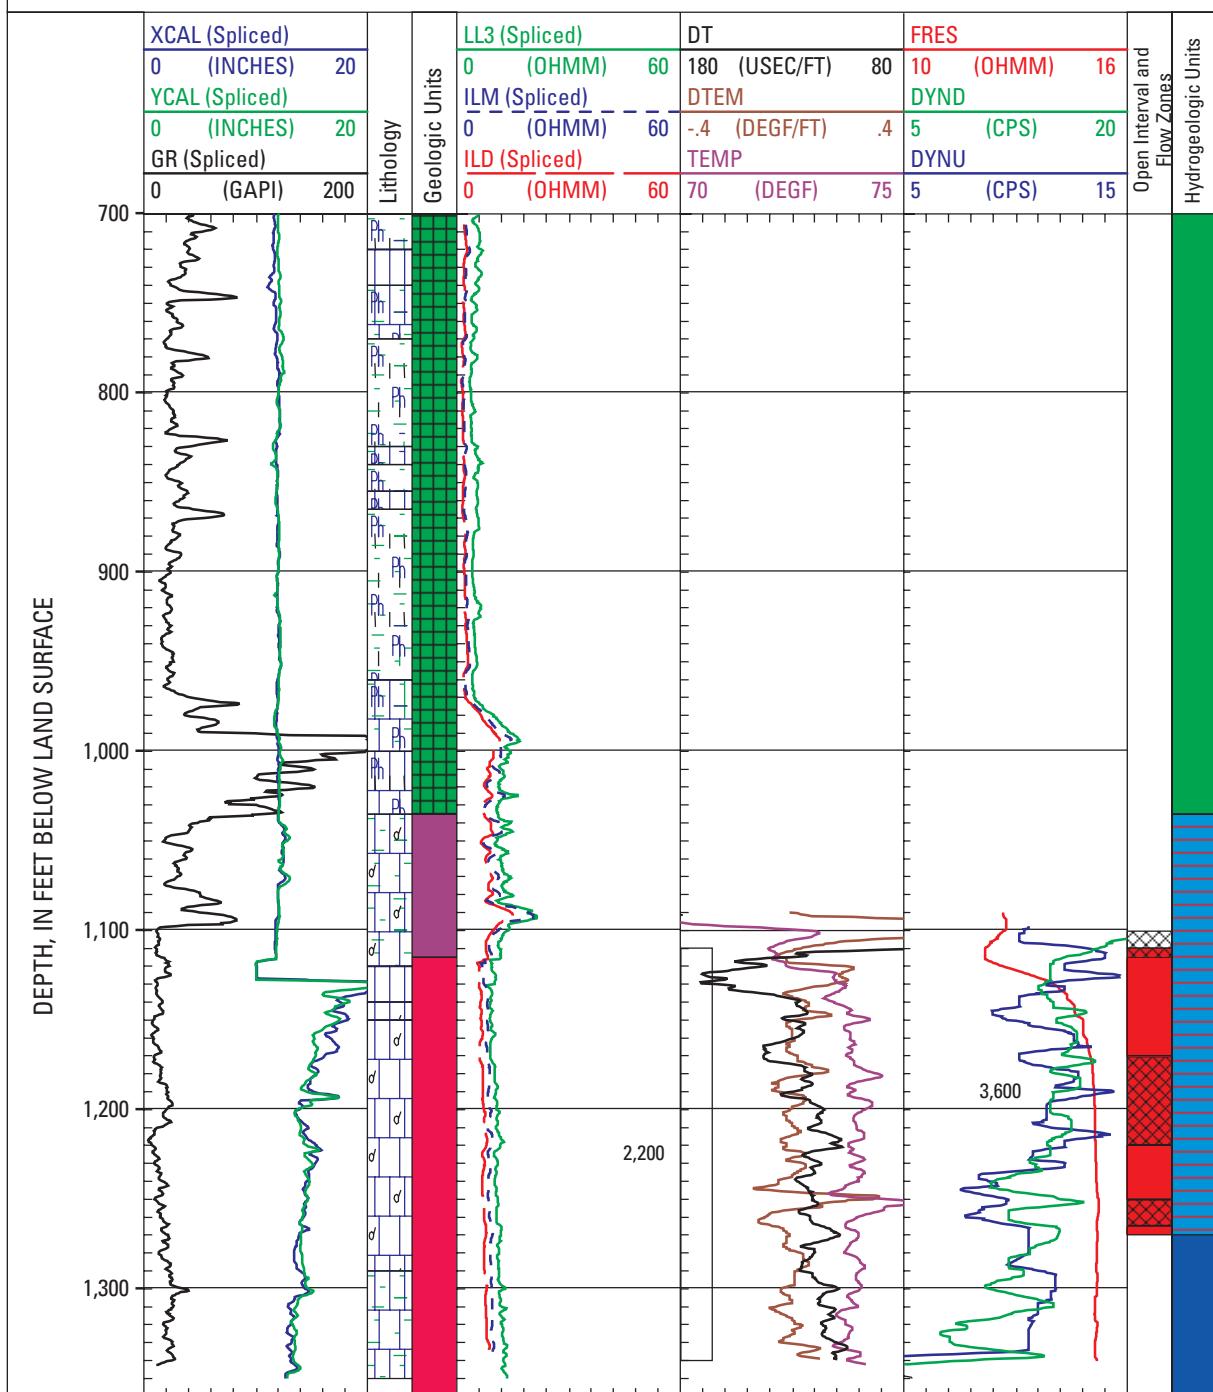

Numbers are chloride concentration in milligrams per liter in water sample obtained from delineated interval. Values are from table 4. The site name and local well number(s) at the top of each log are followed by the USGS well number in parentheses.

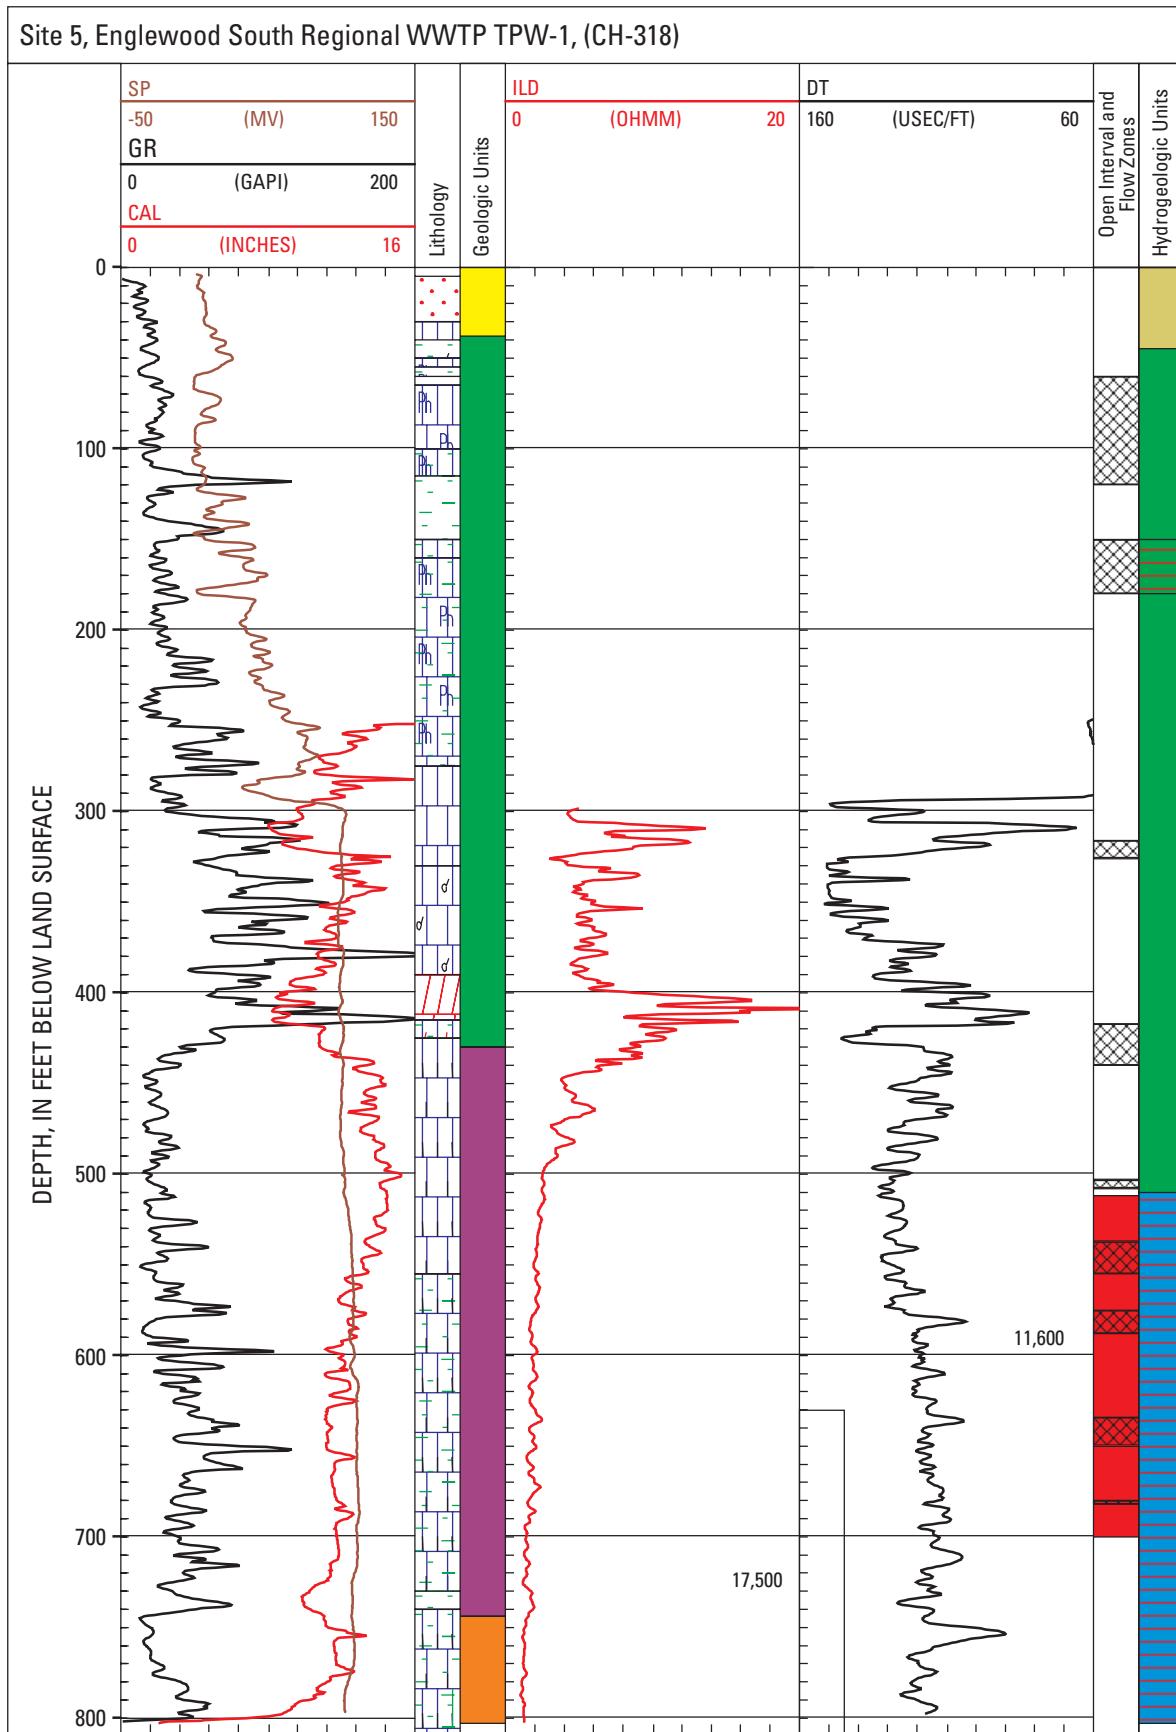

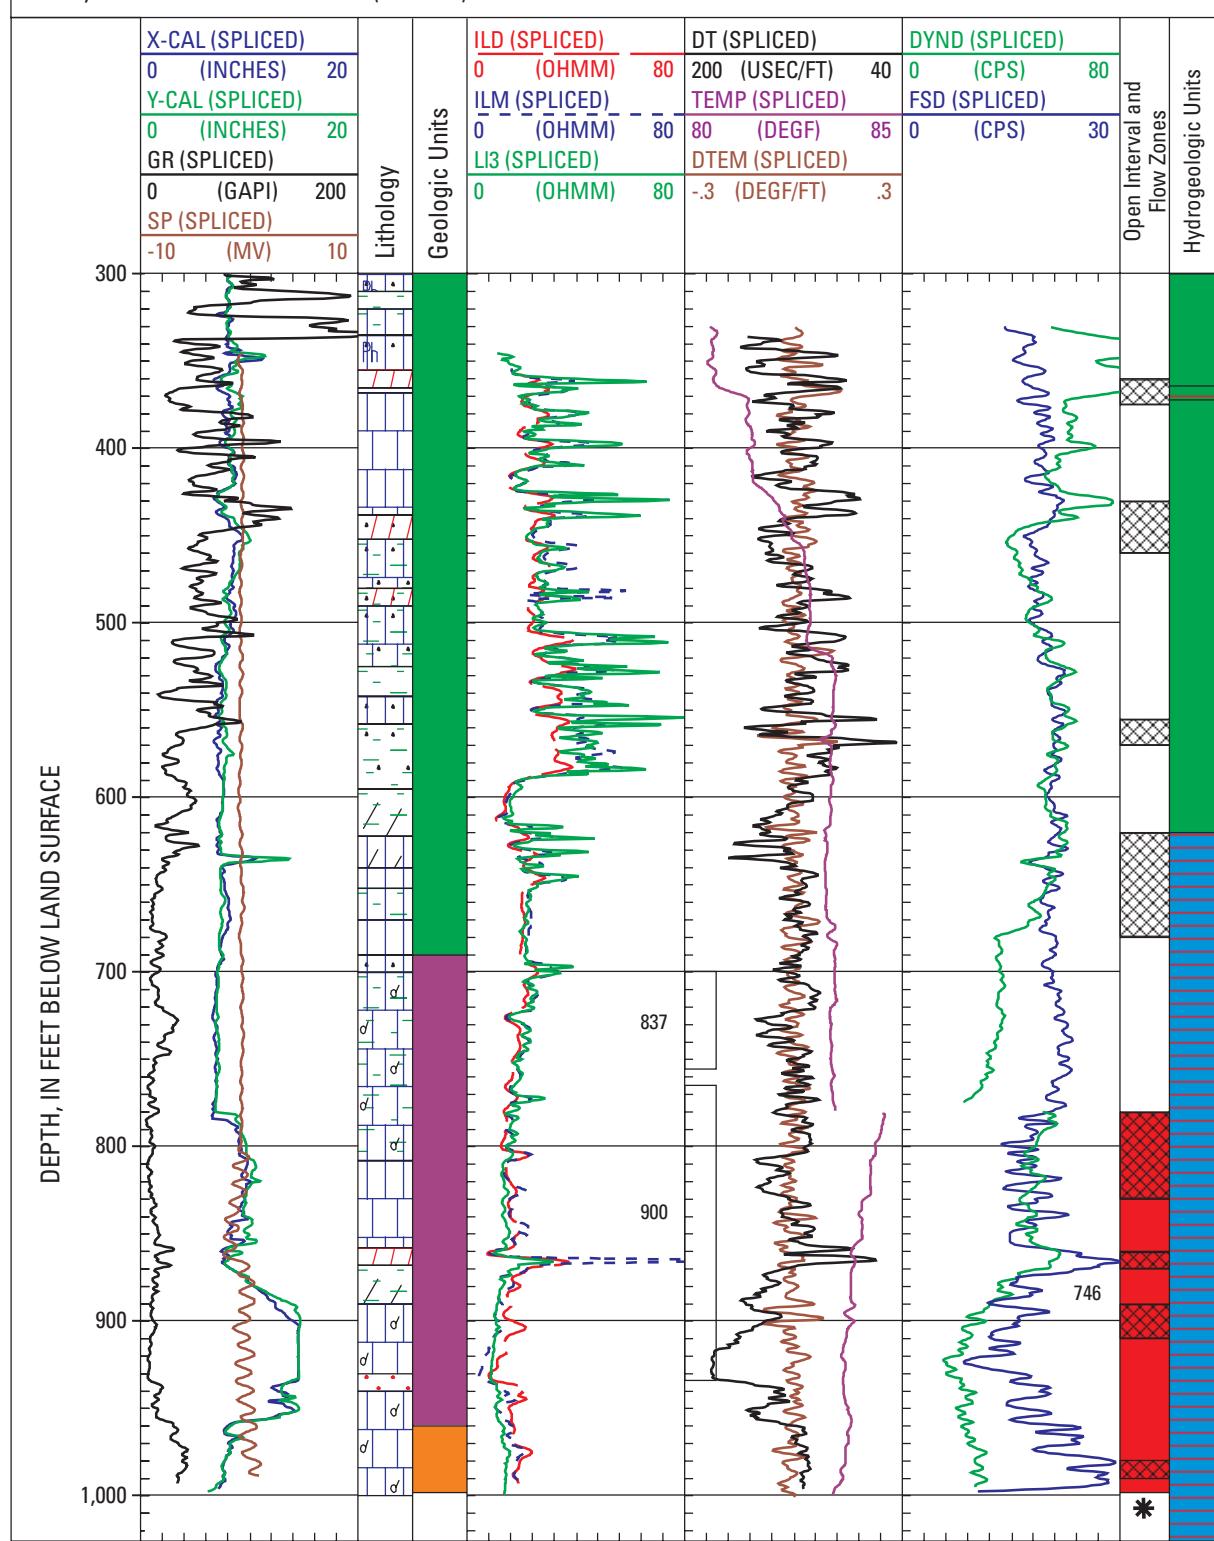

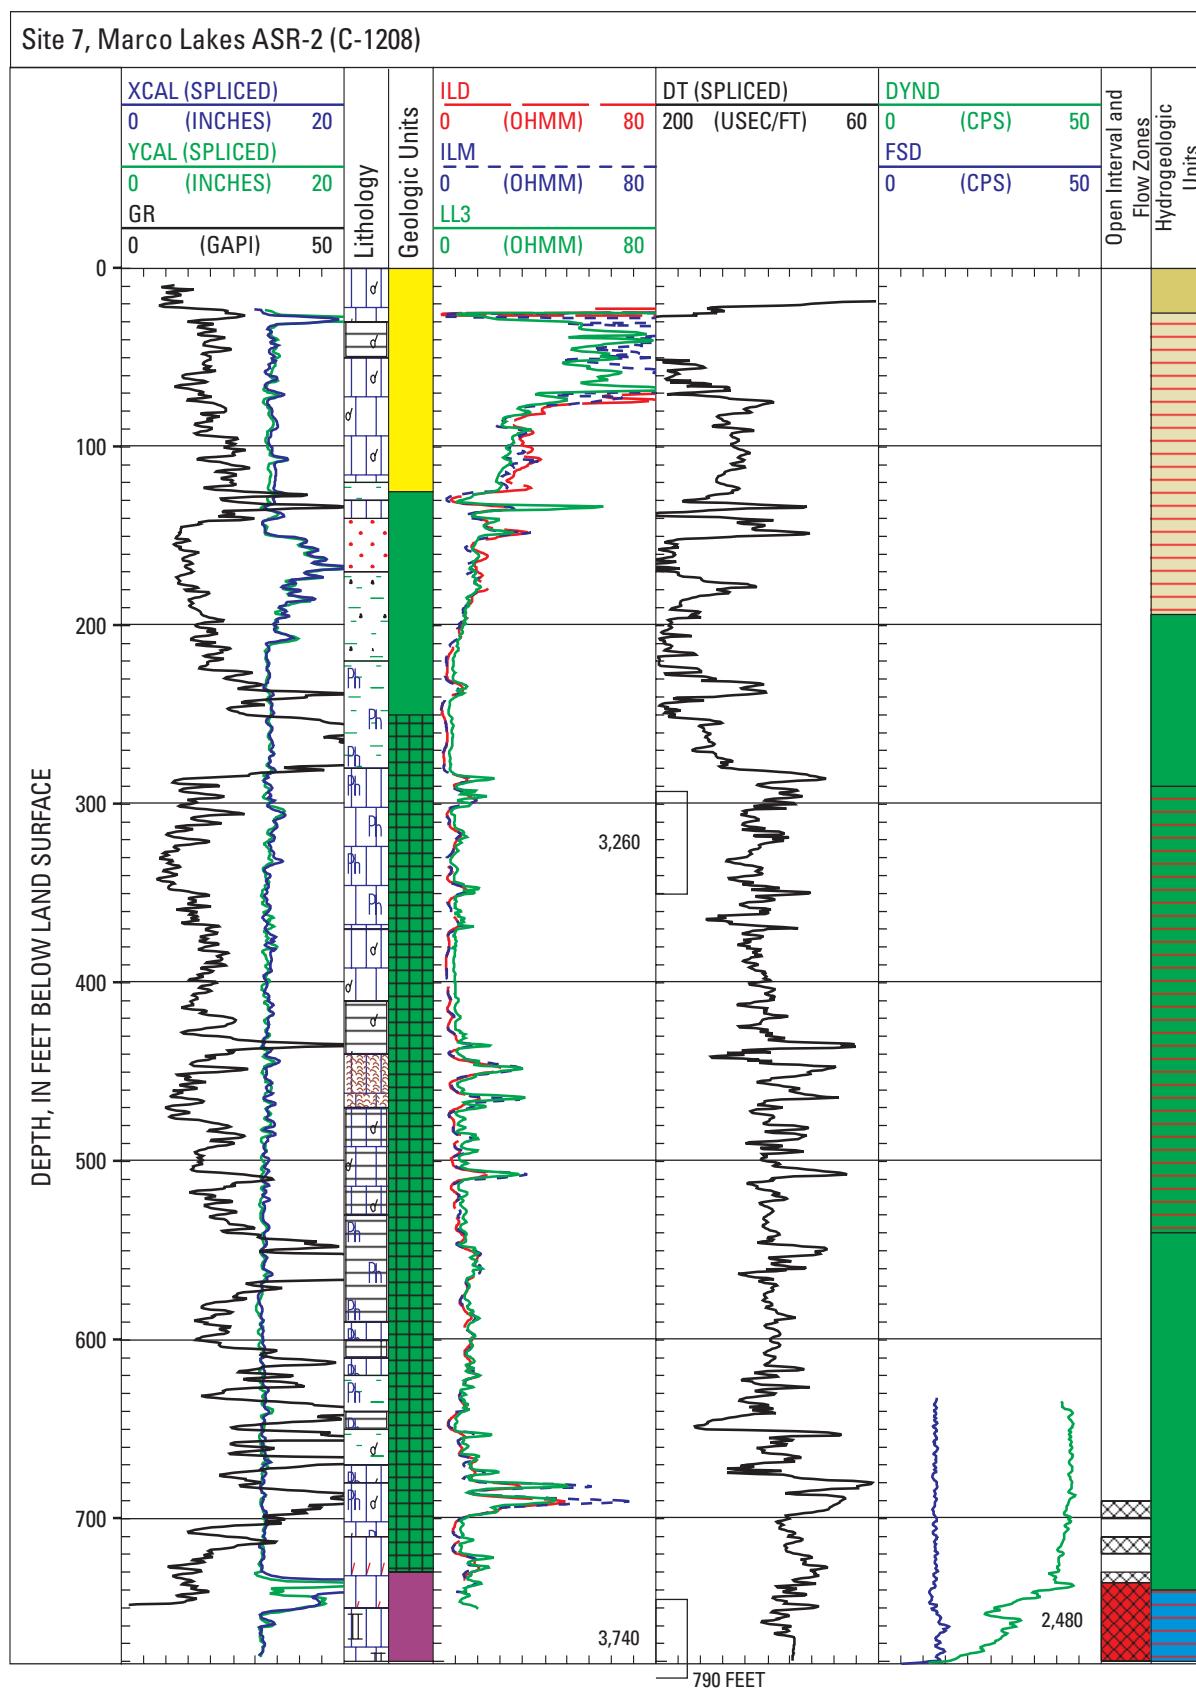

Site 4, Springtree WTP ASR-1 (G-2914)

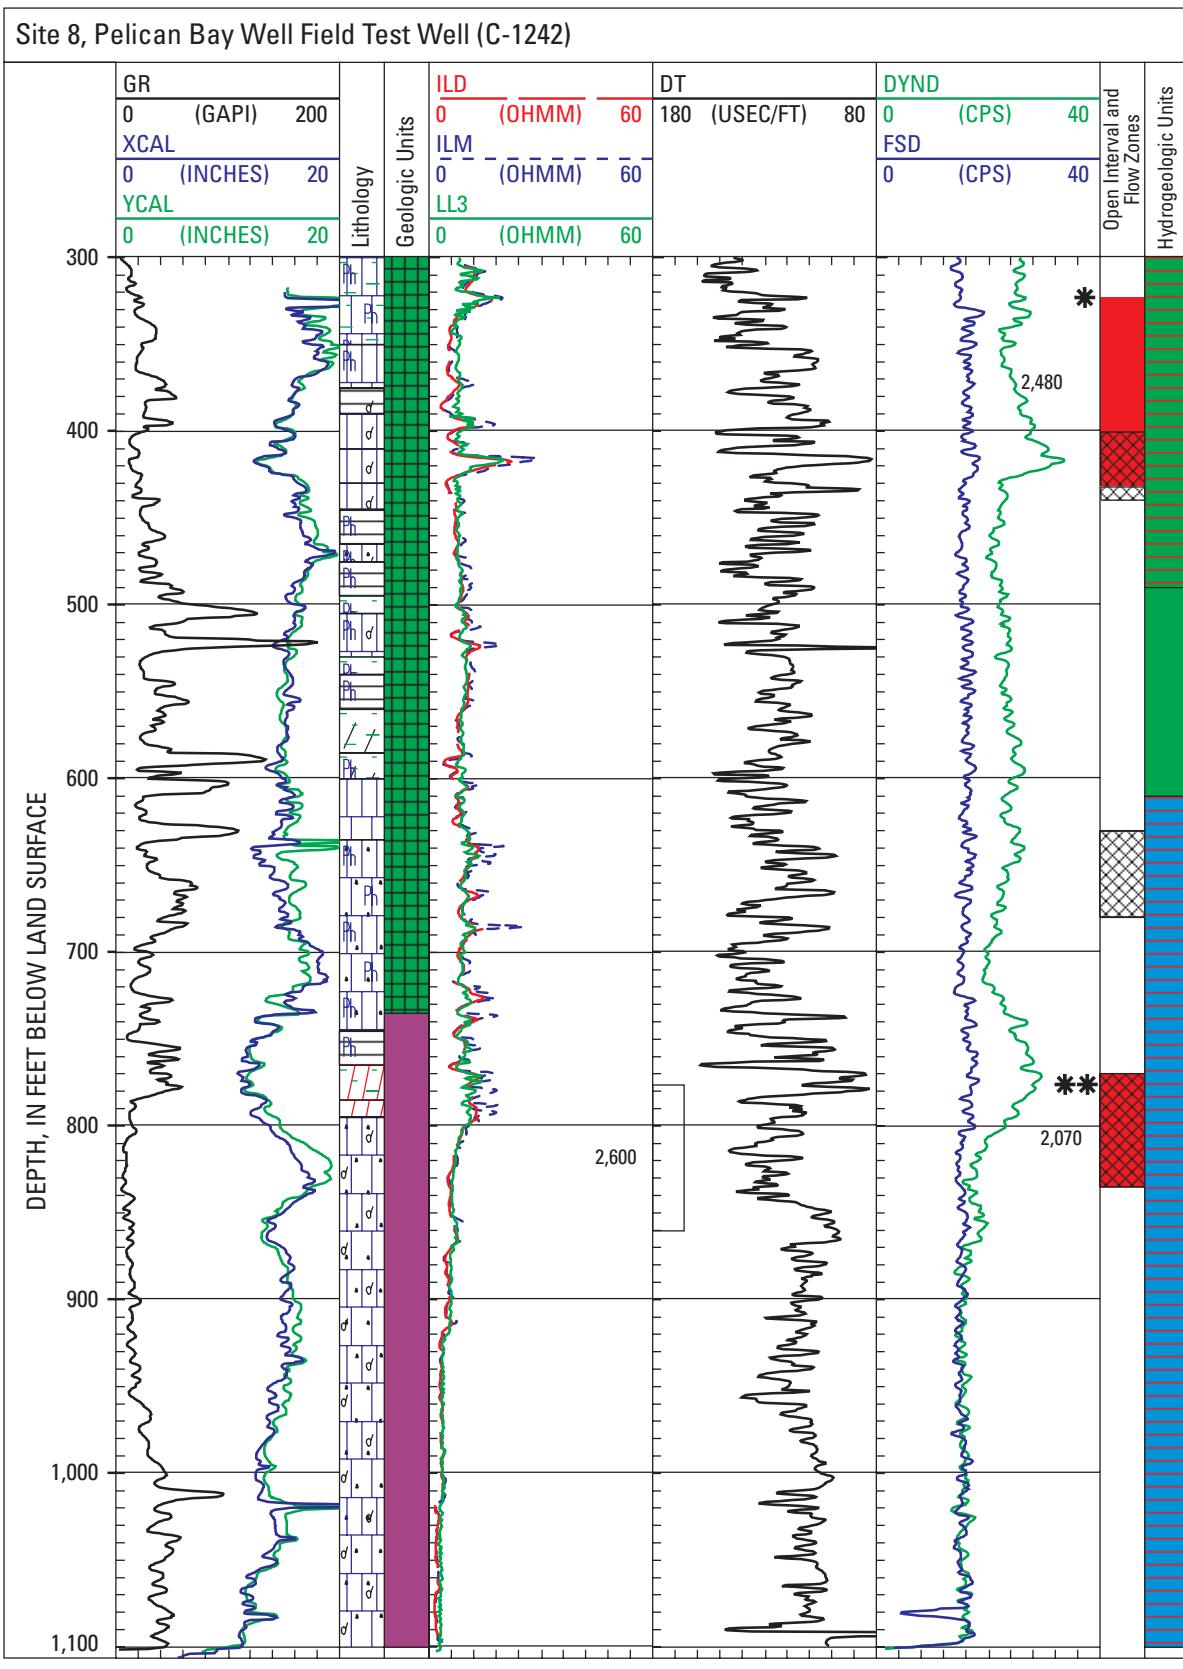

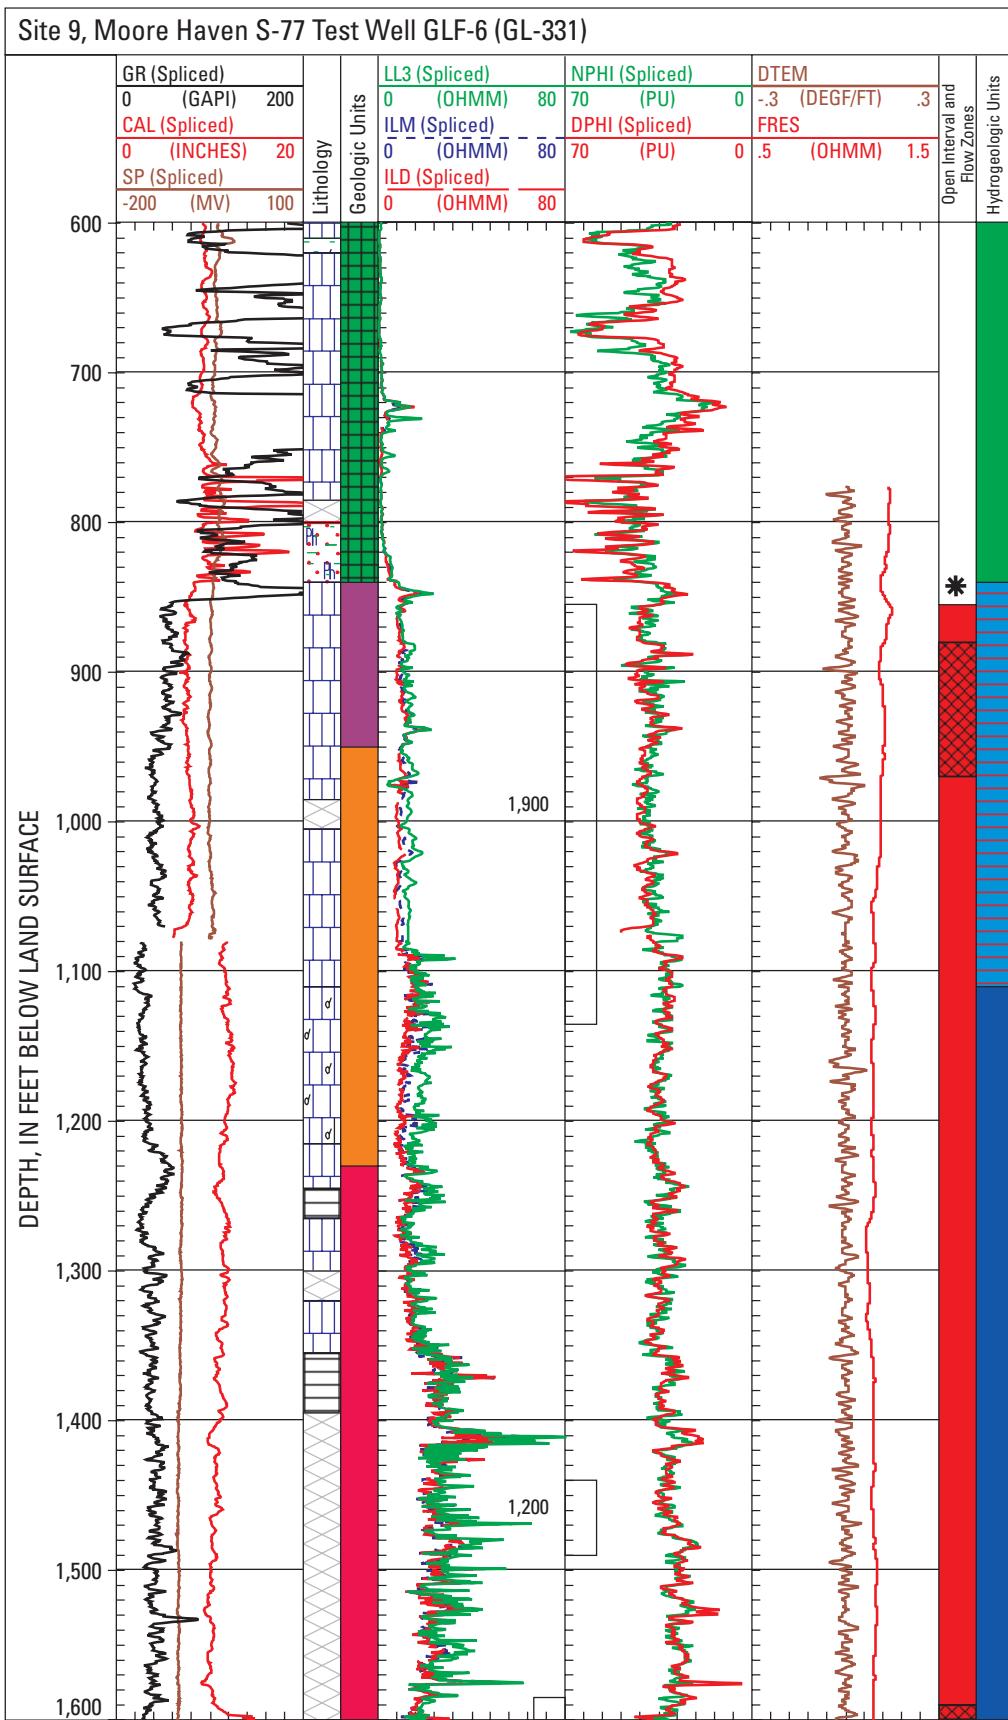

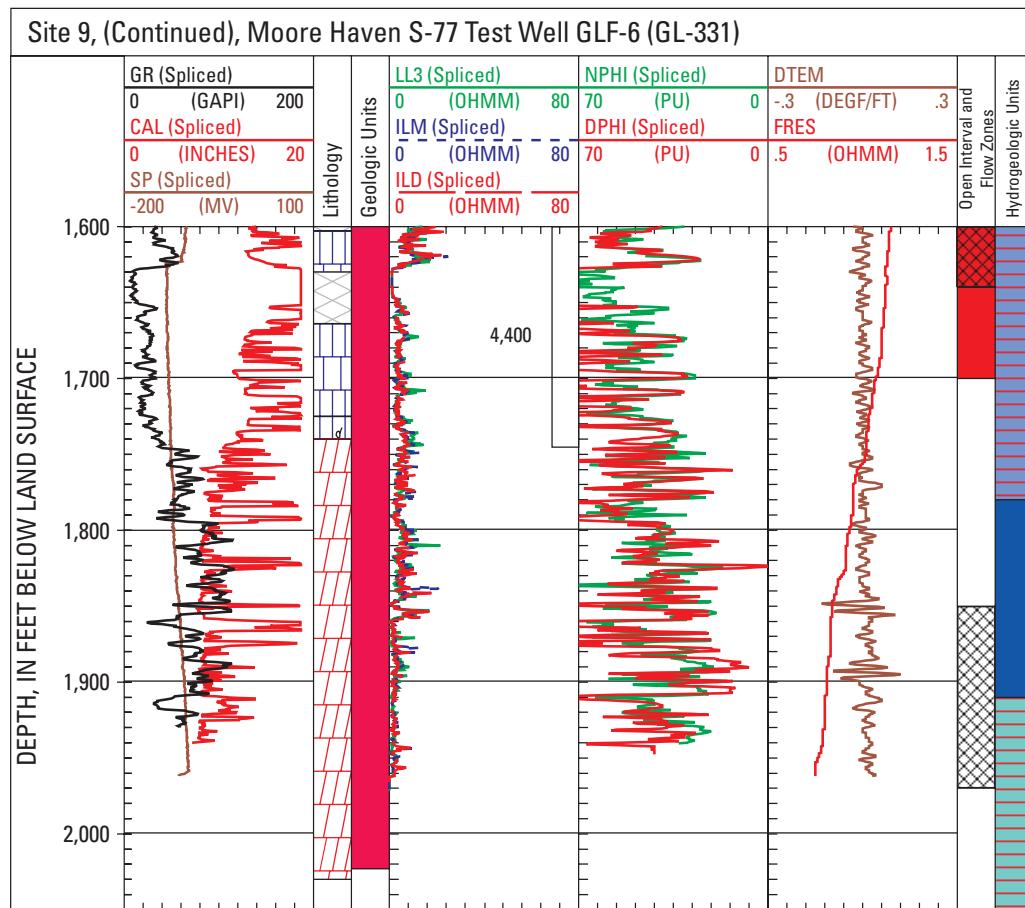

Site 6, Shell Creek WTP ASR-2 (CH-316)

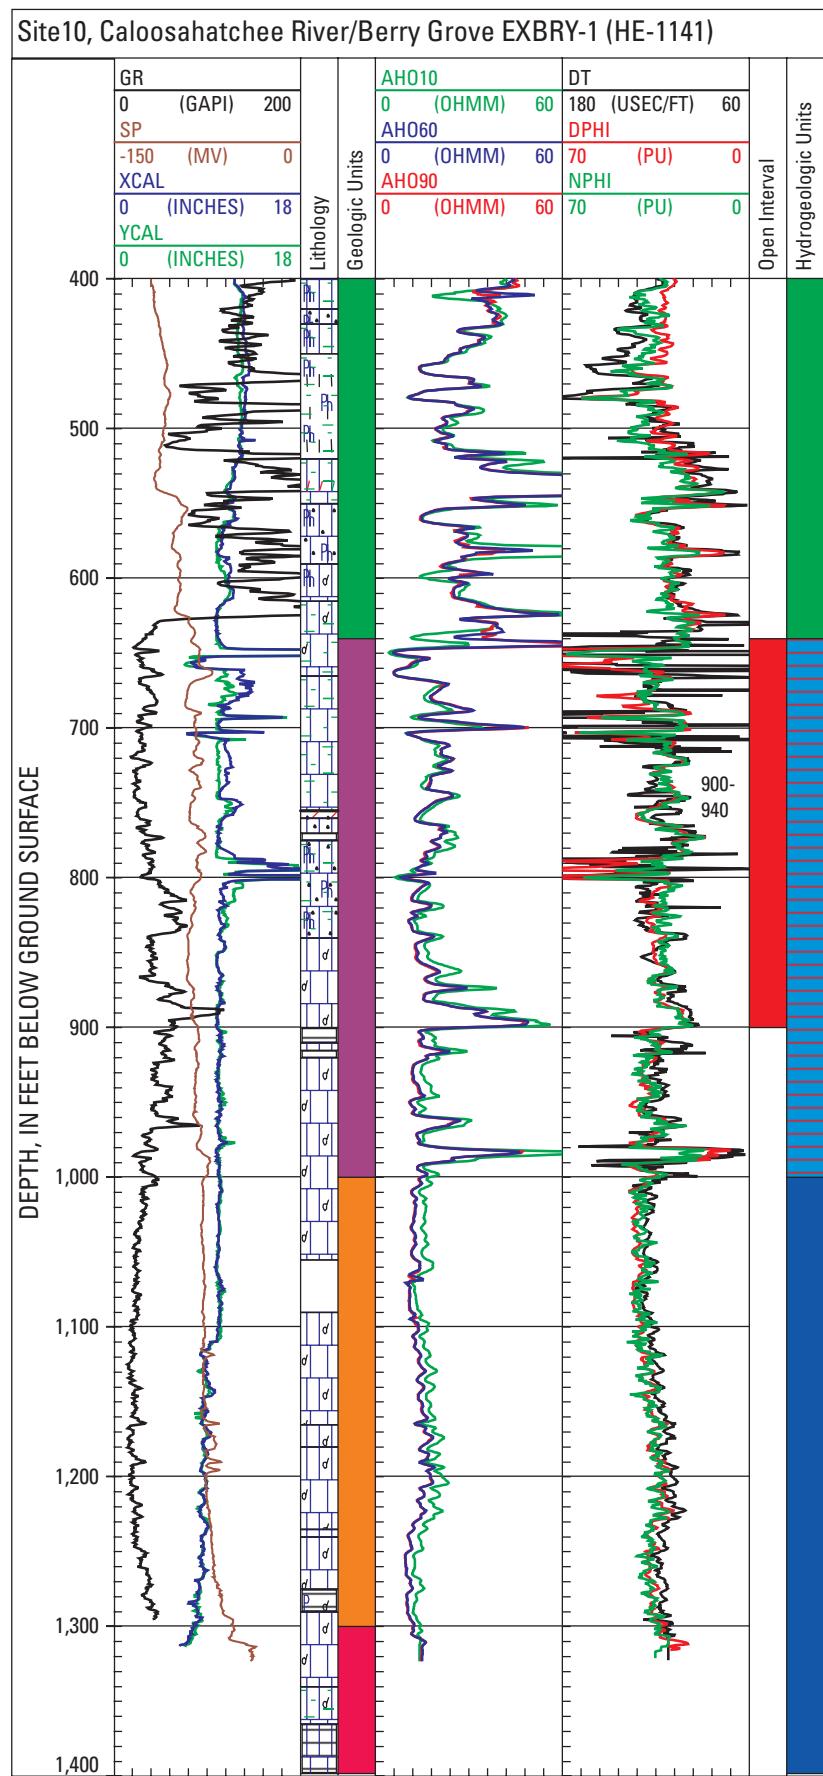

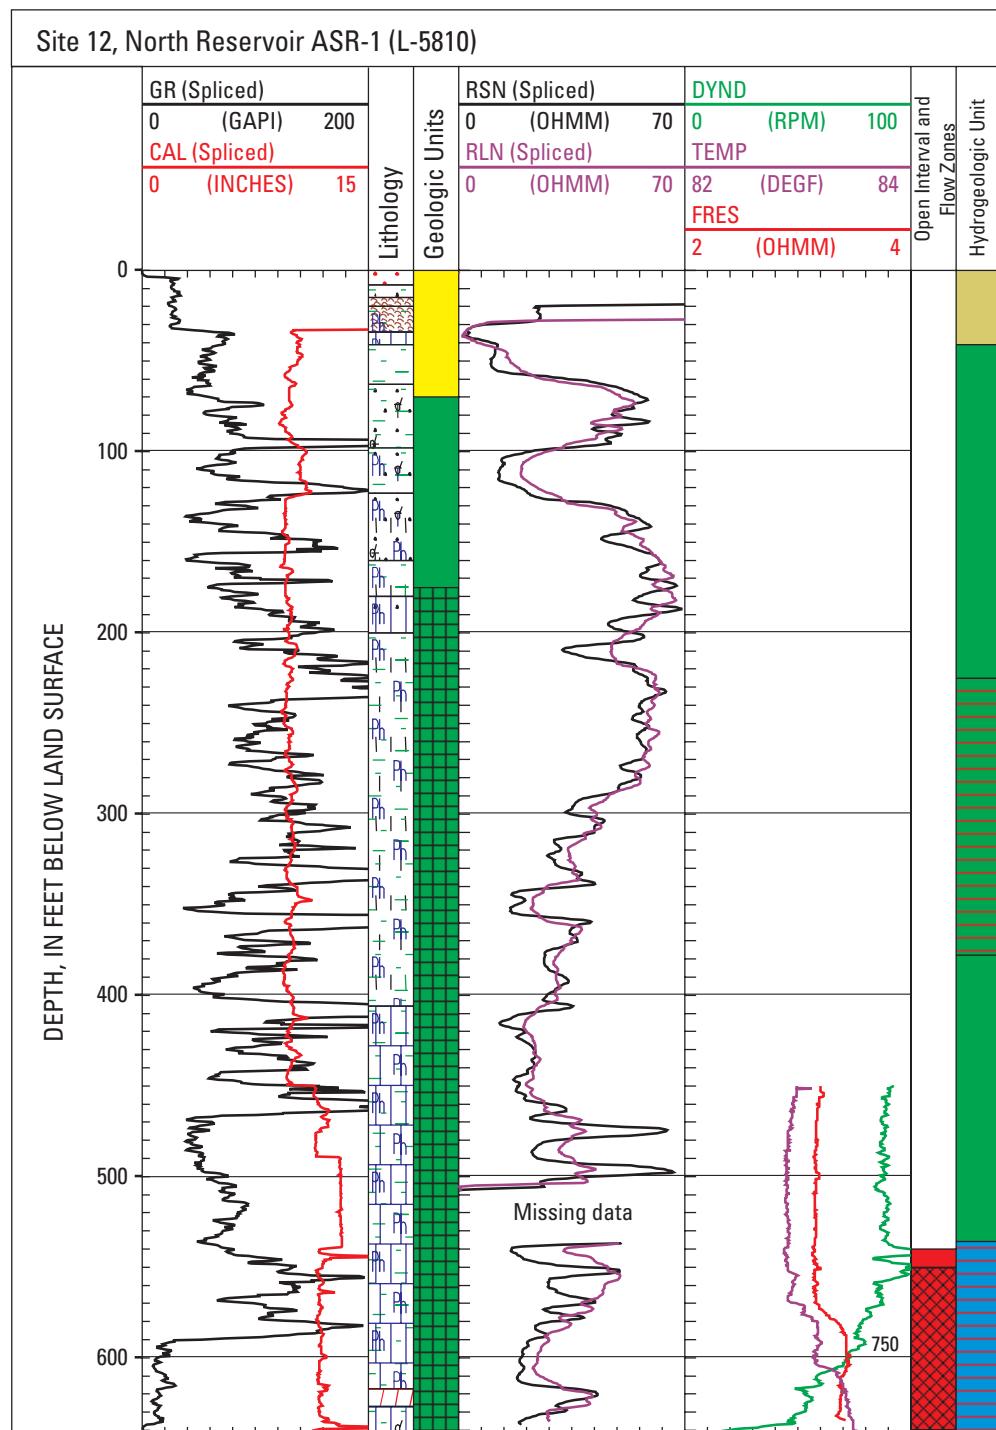

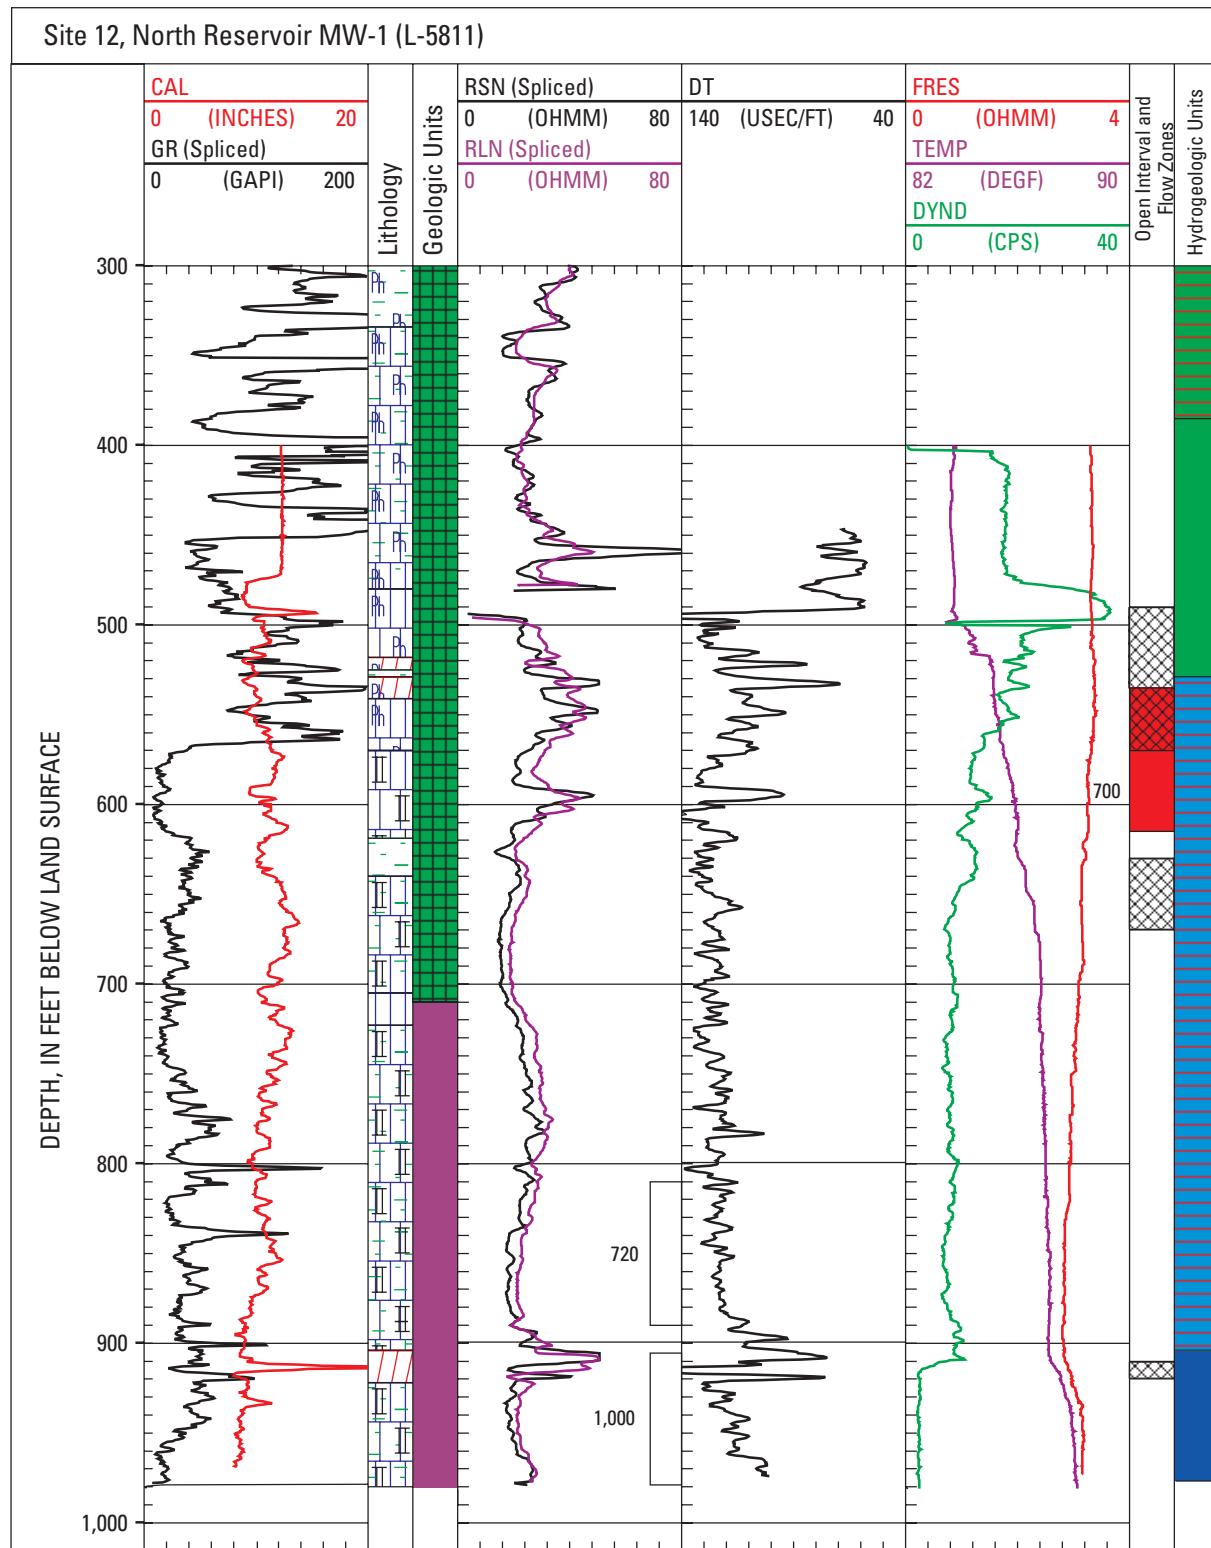

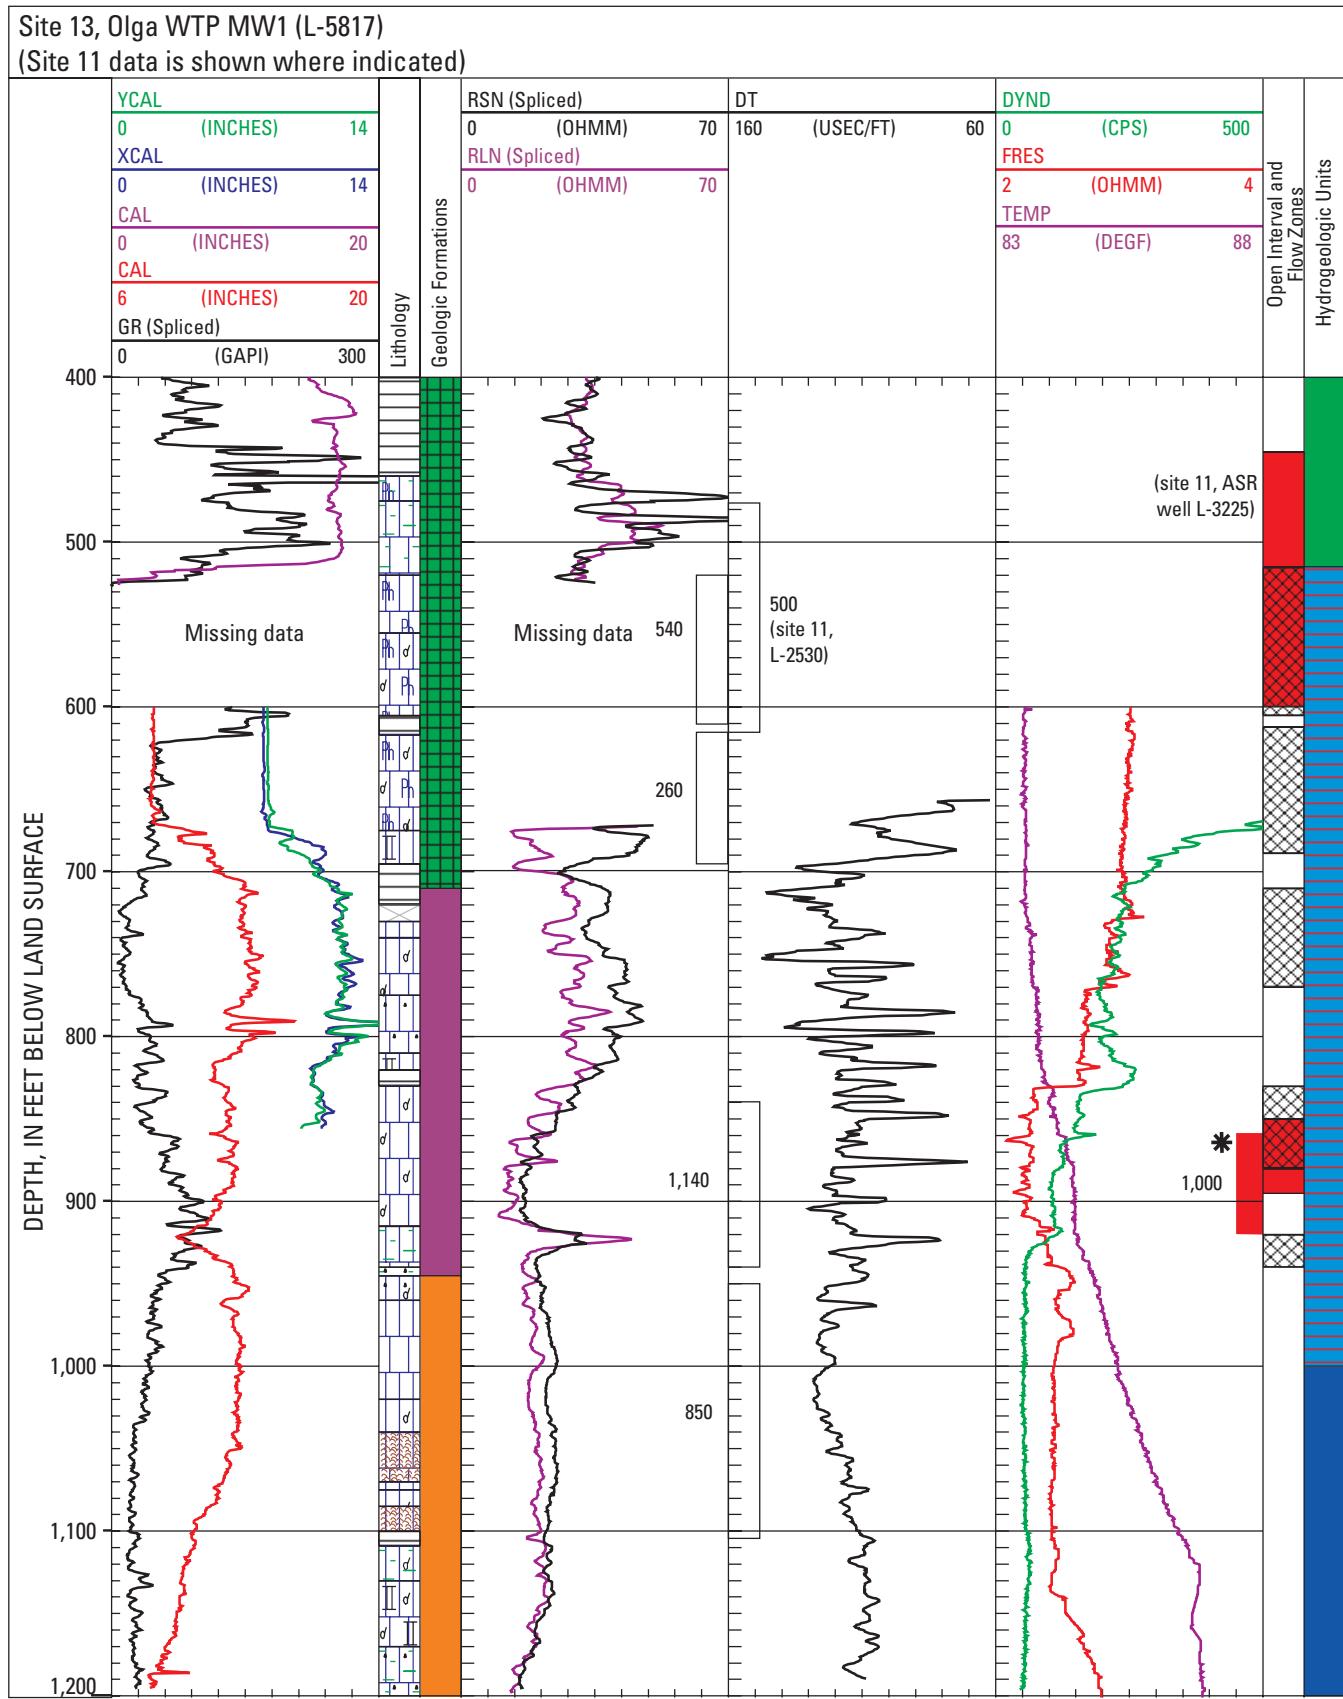

* Well not completed. Present open interval is from 855 to 1,700 feet.

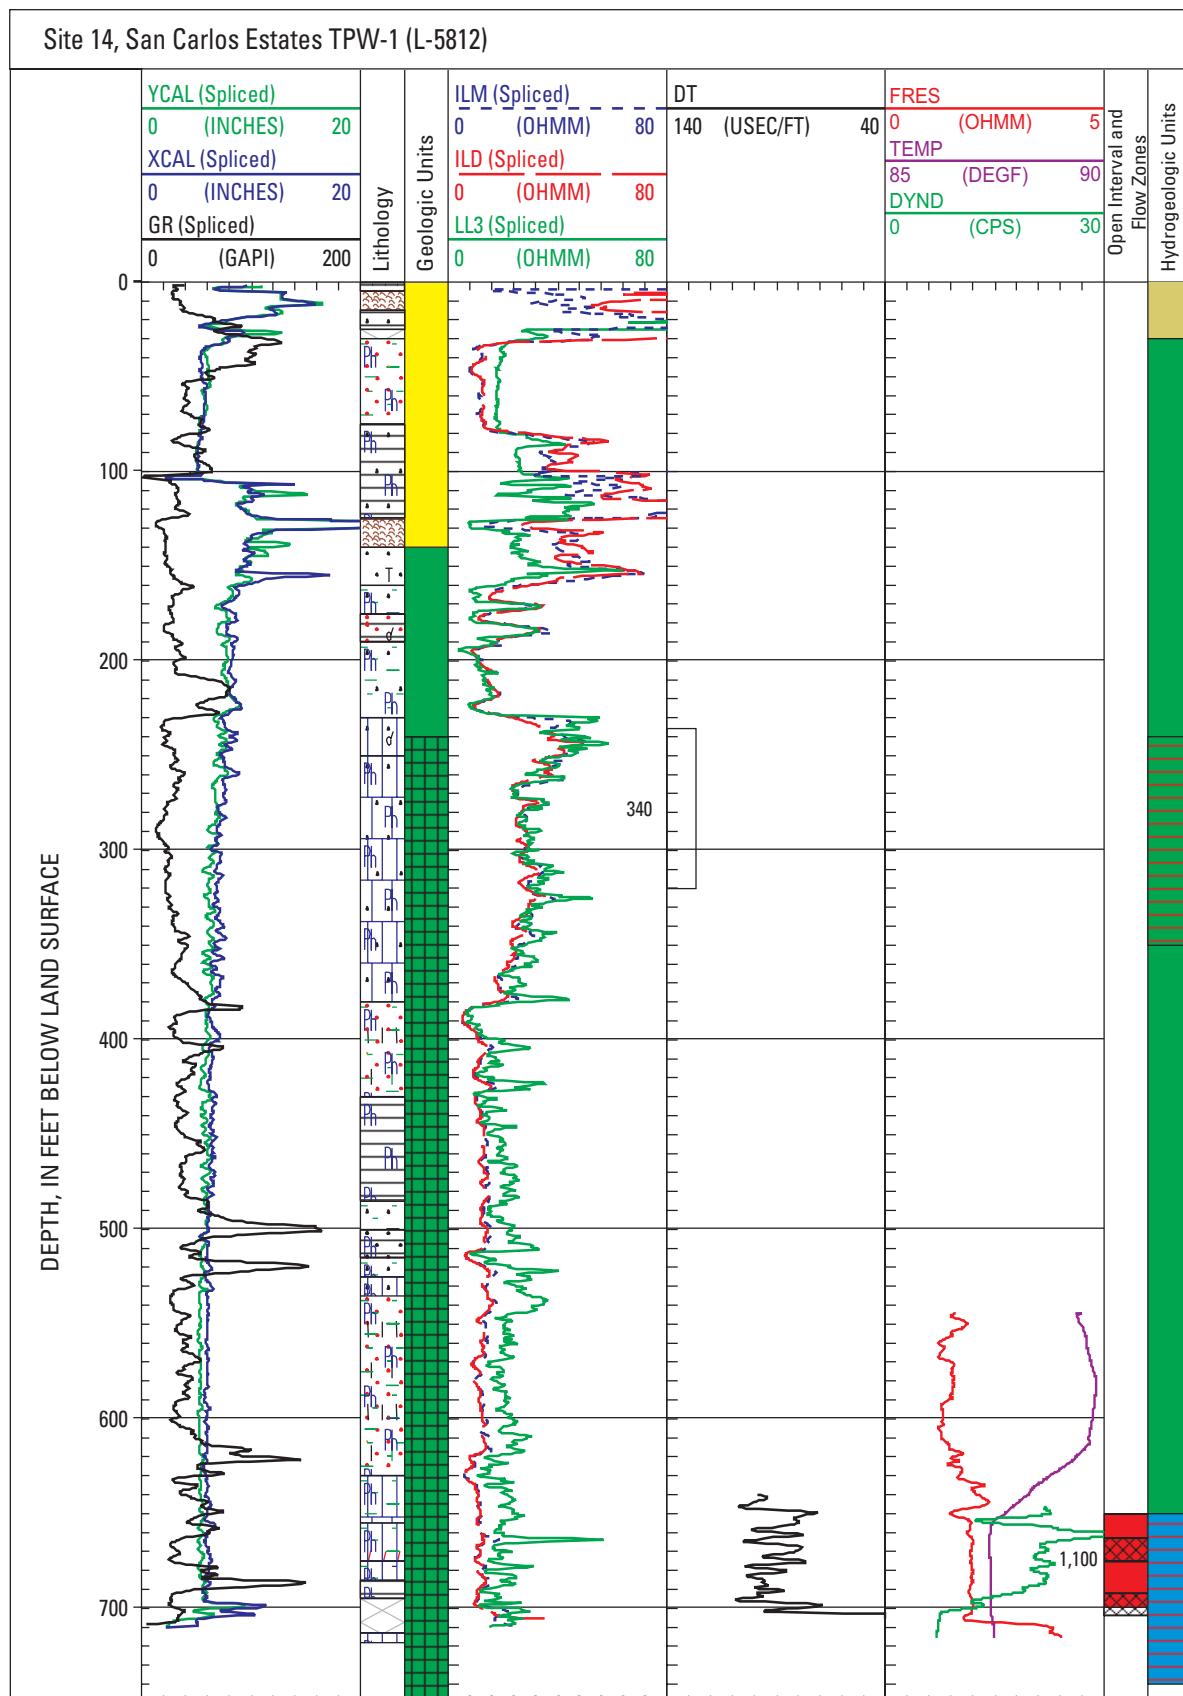

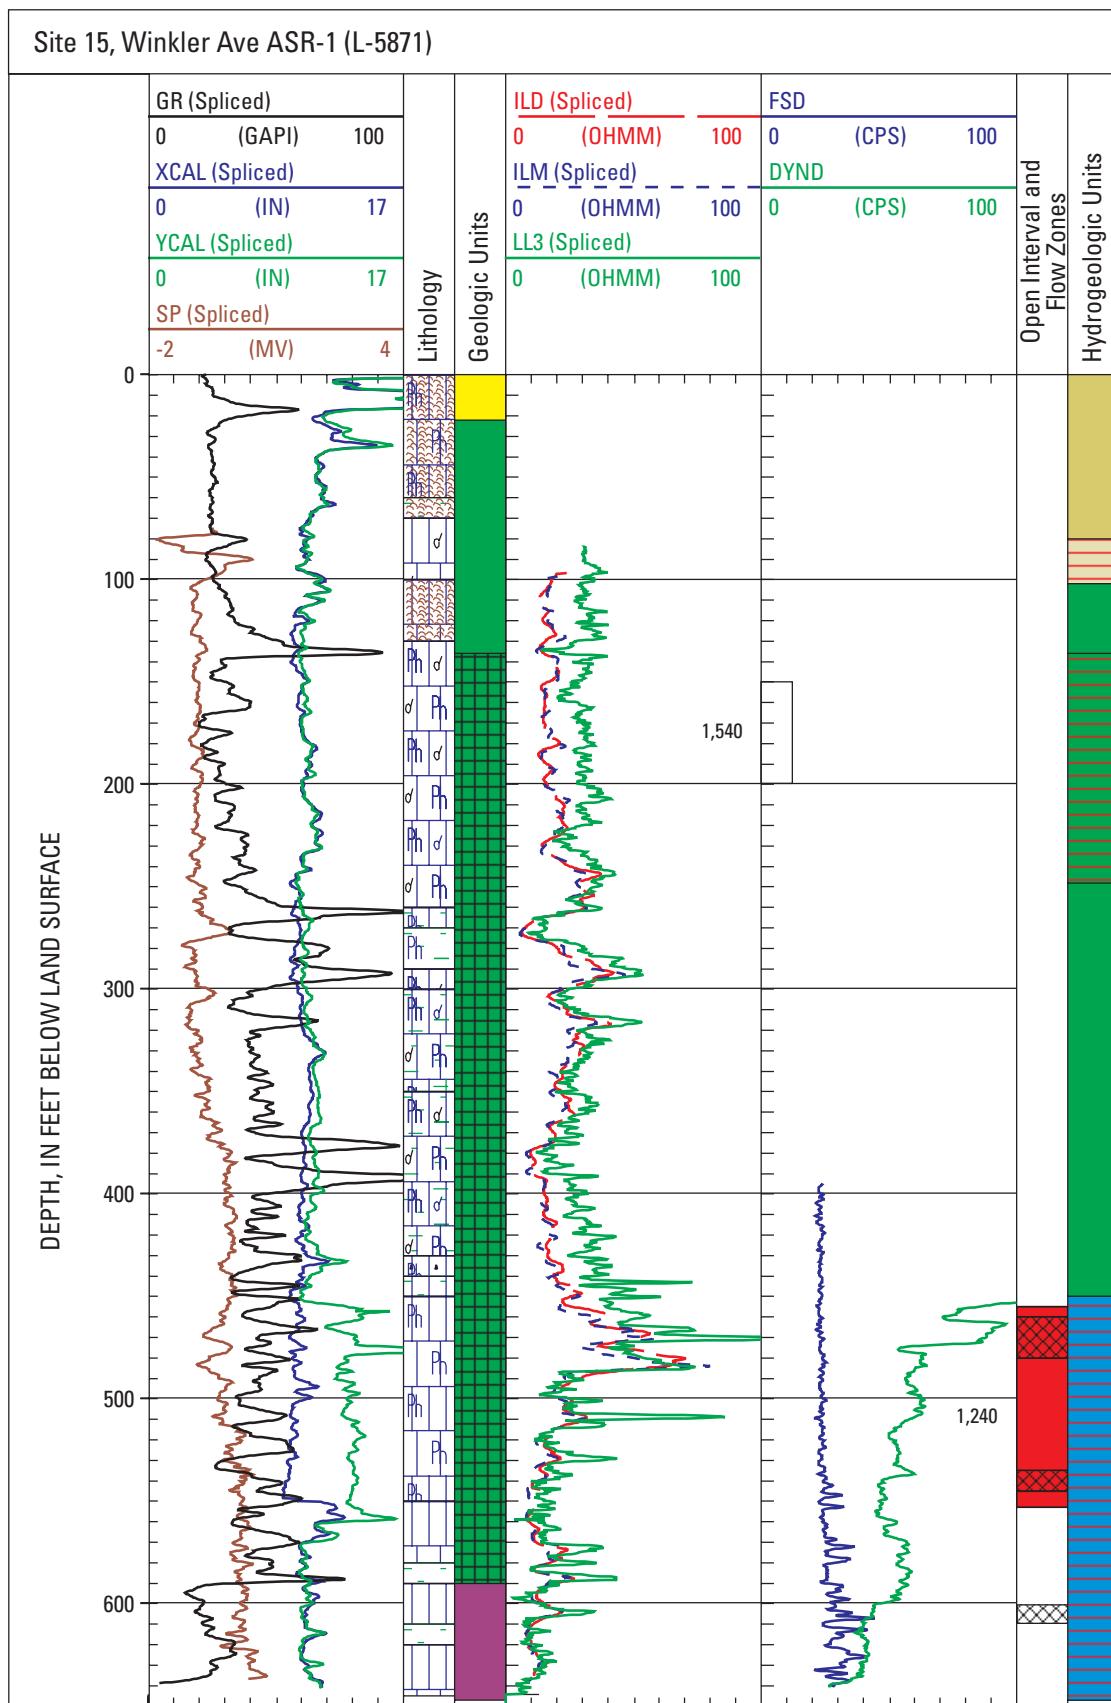

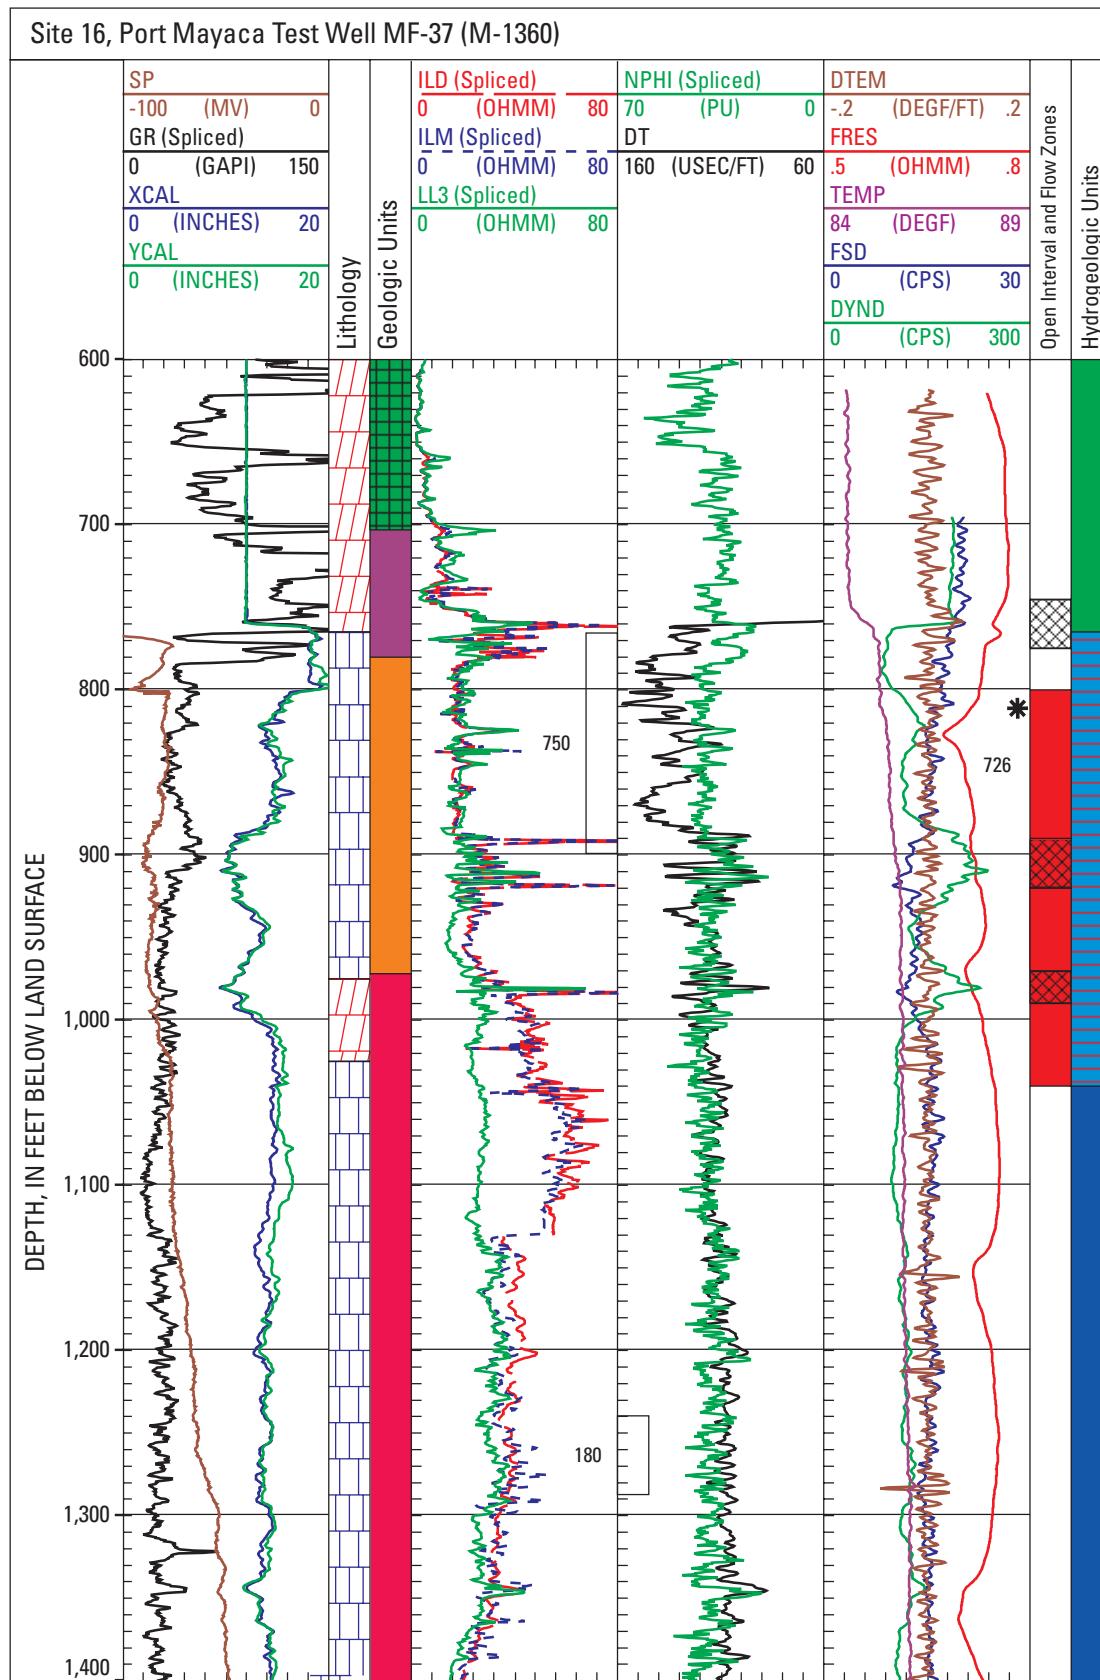

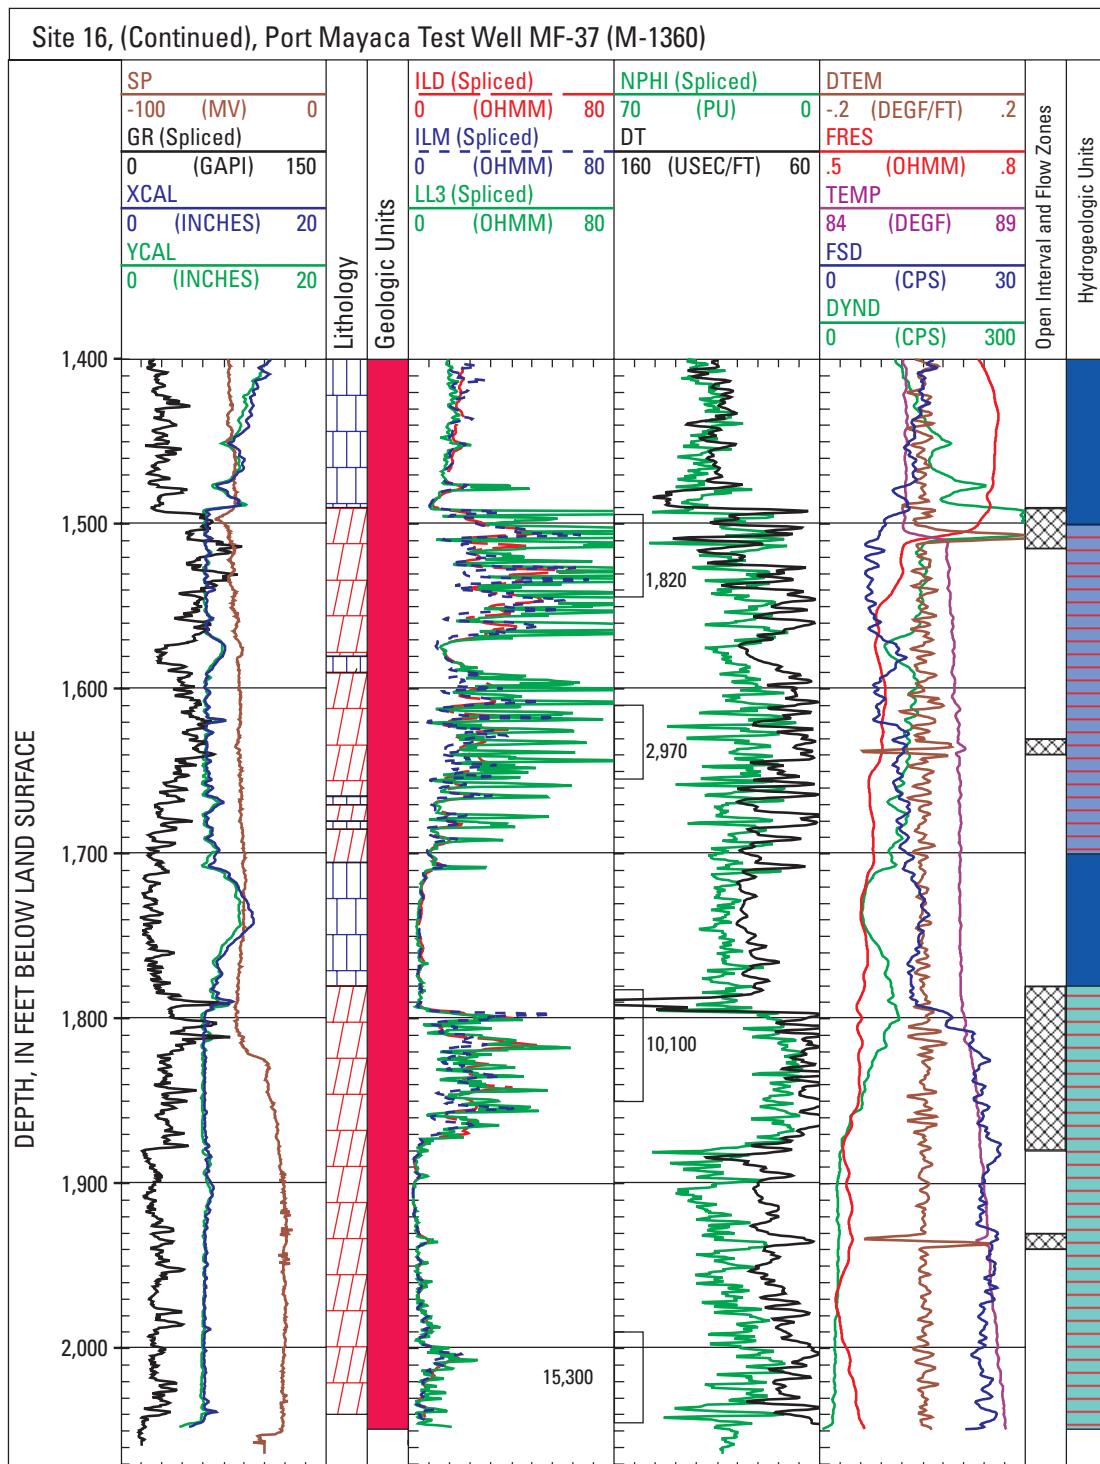

* Open interval is for Olga WTP well ASR-1

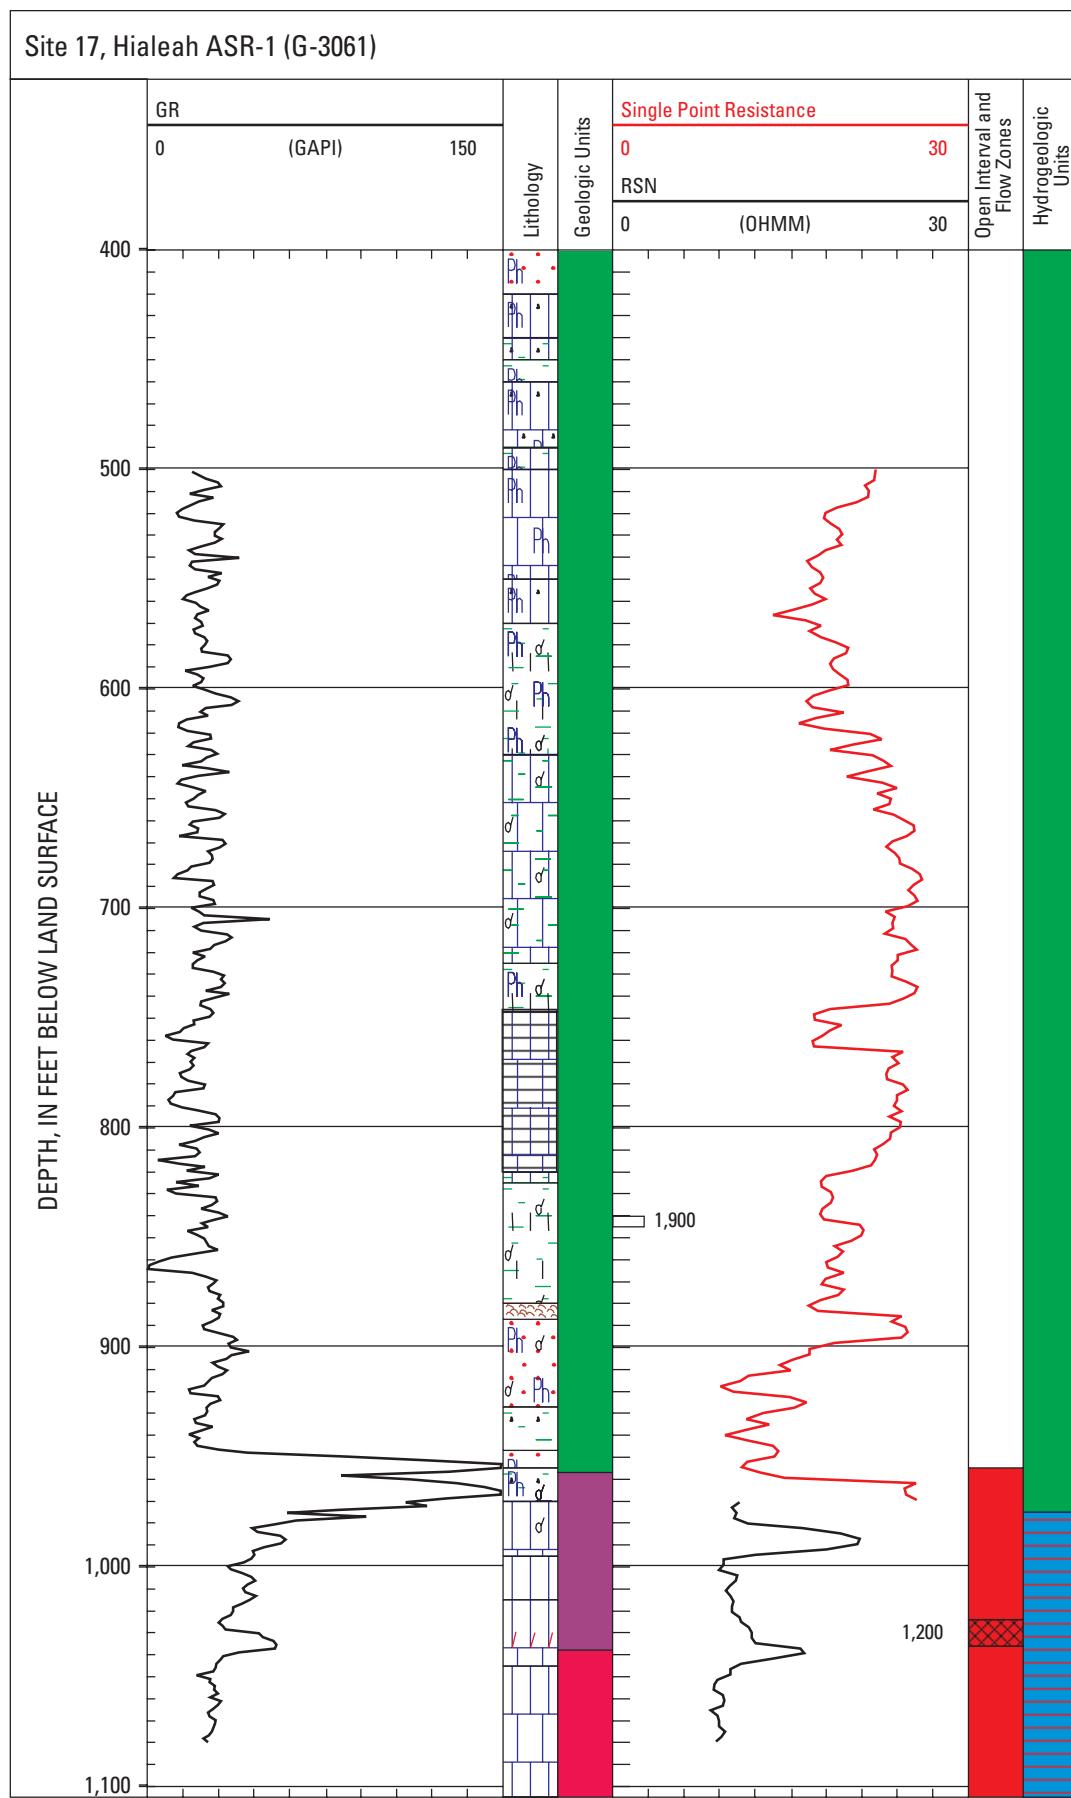

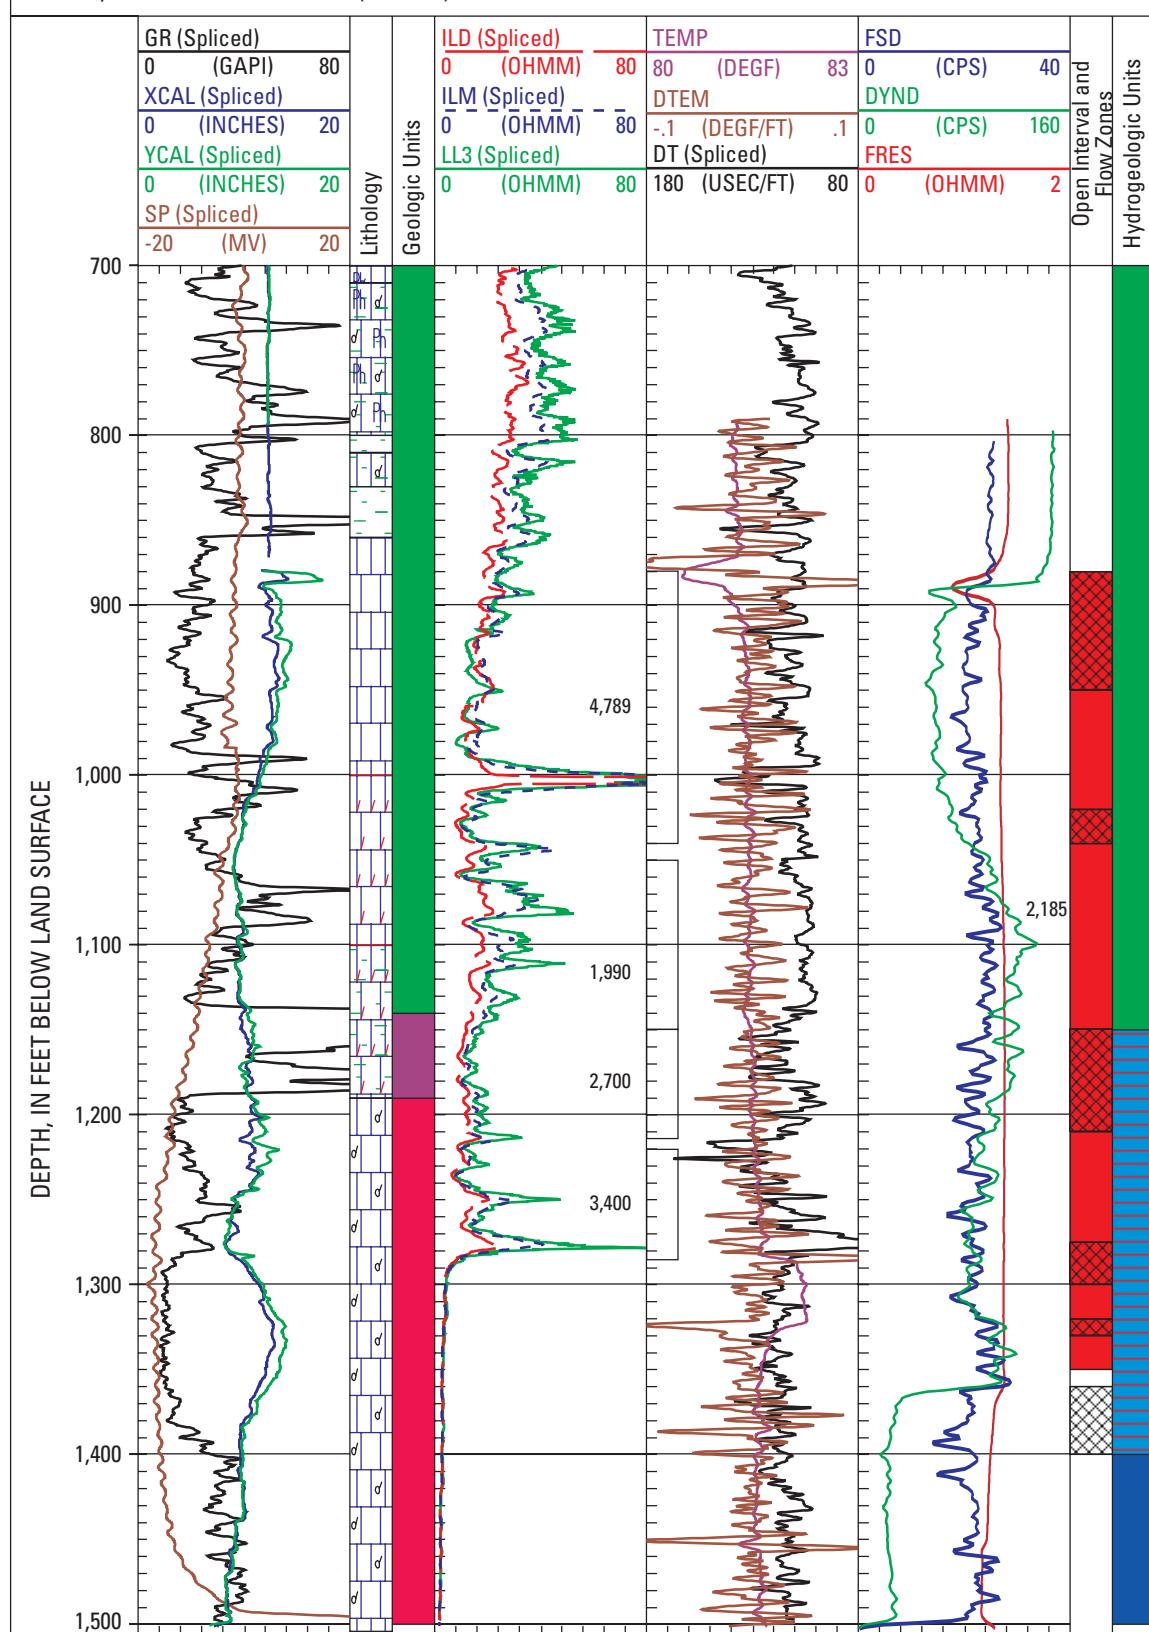

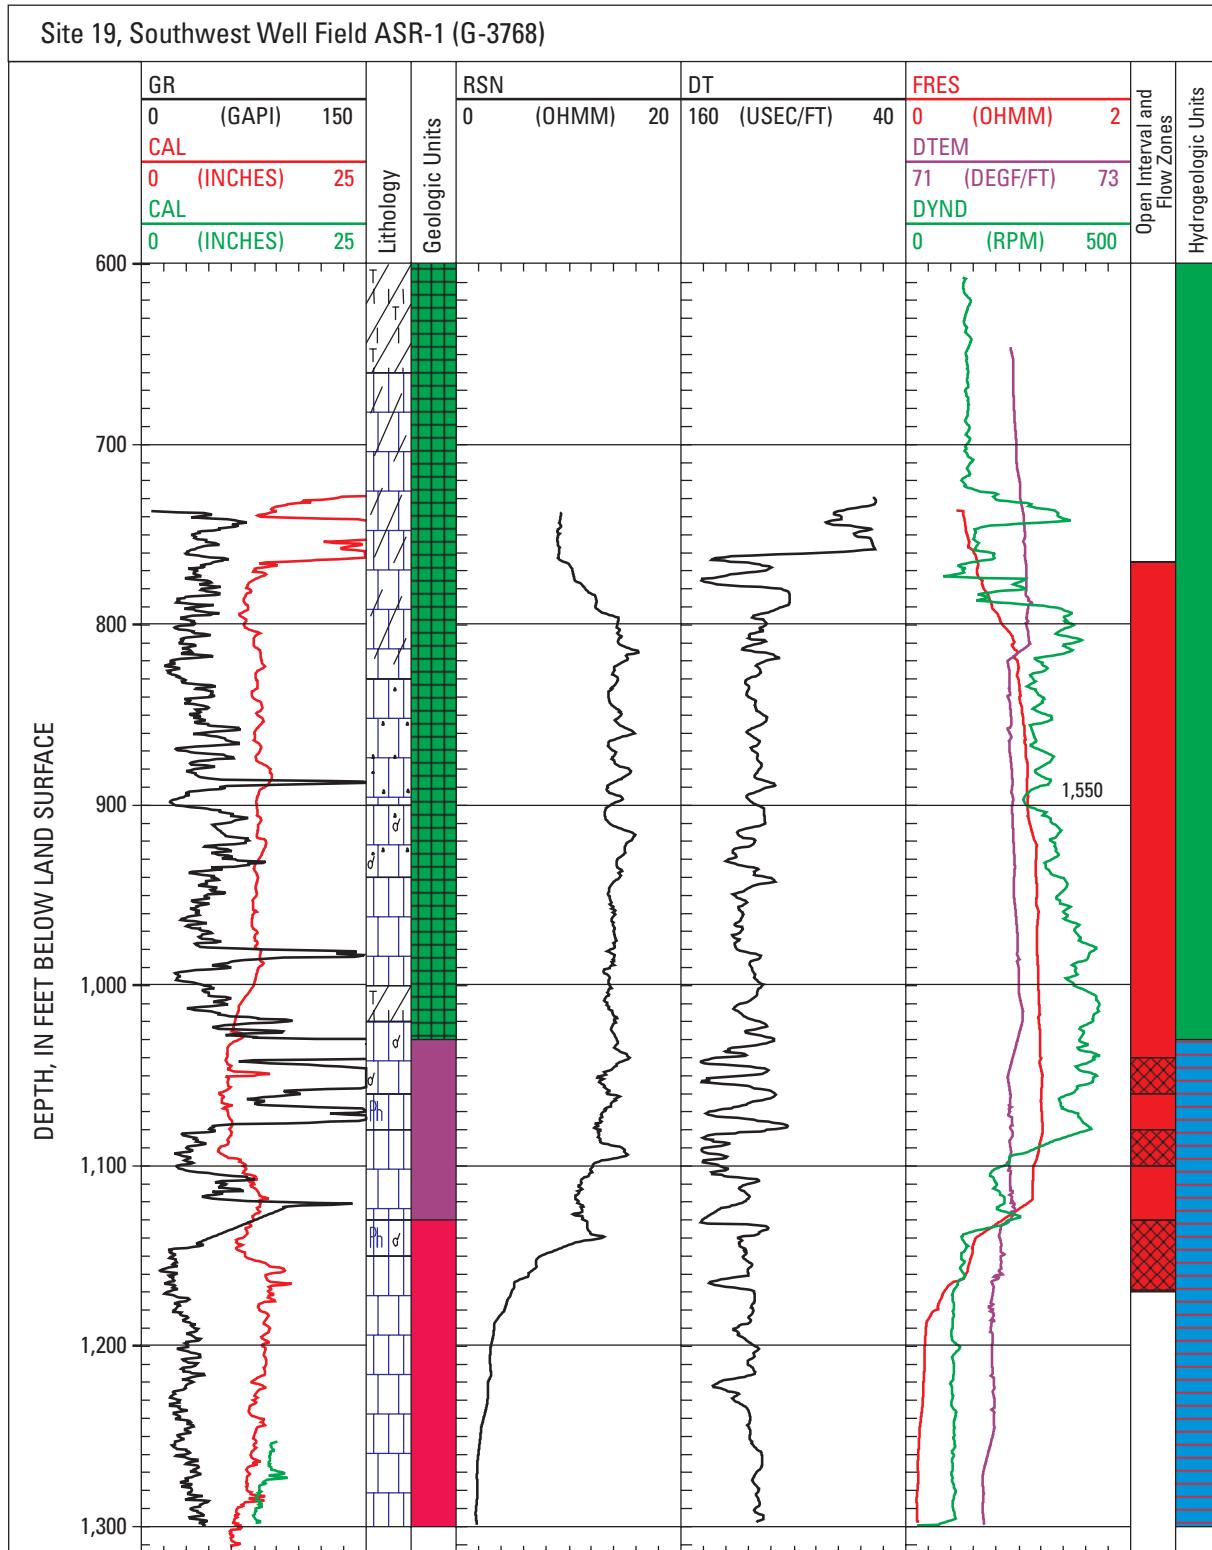

* Open interval is for well EXPM-1 (M-1361) at the same site. Well MF-37 has not been completed, but casing was set at 765 feet.

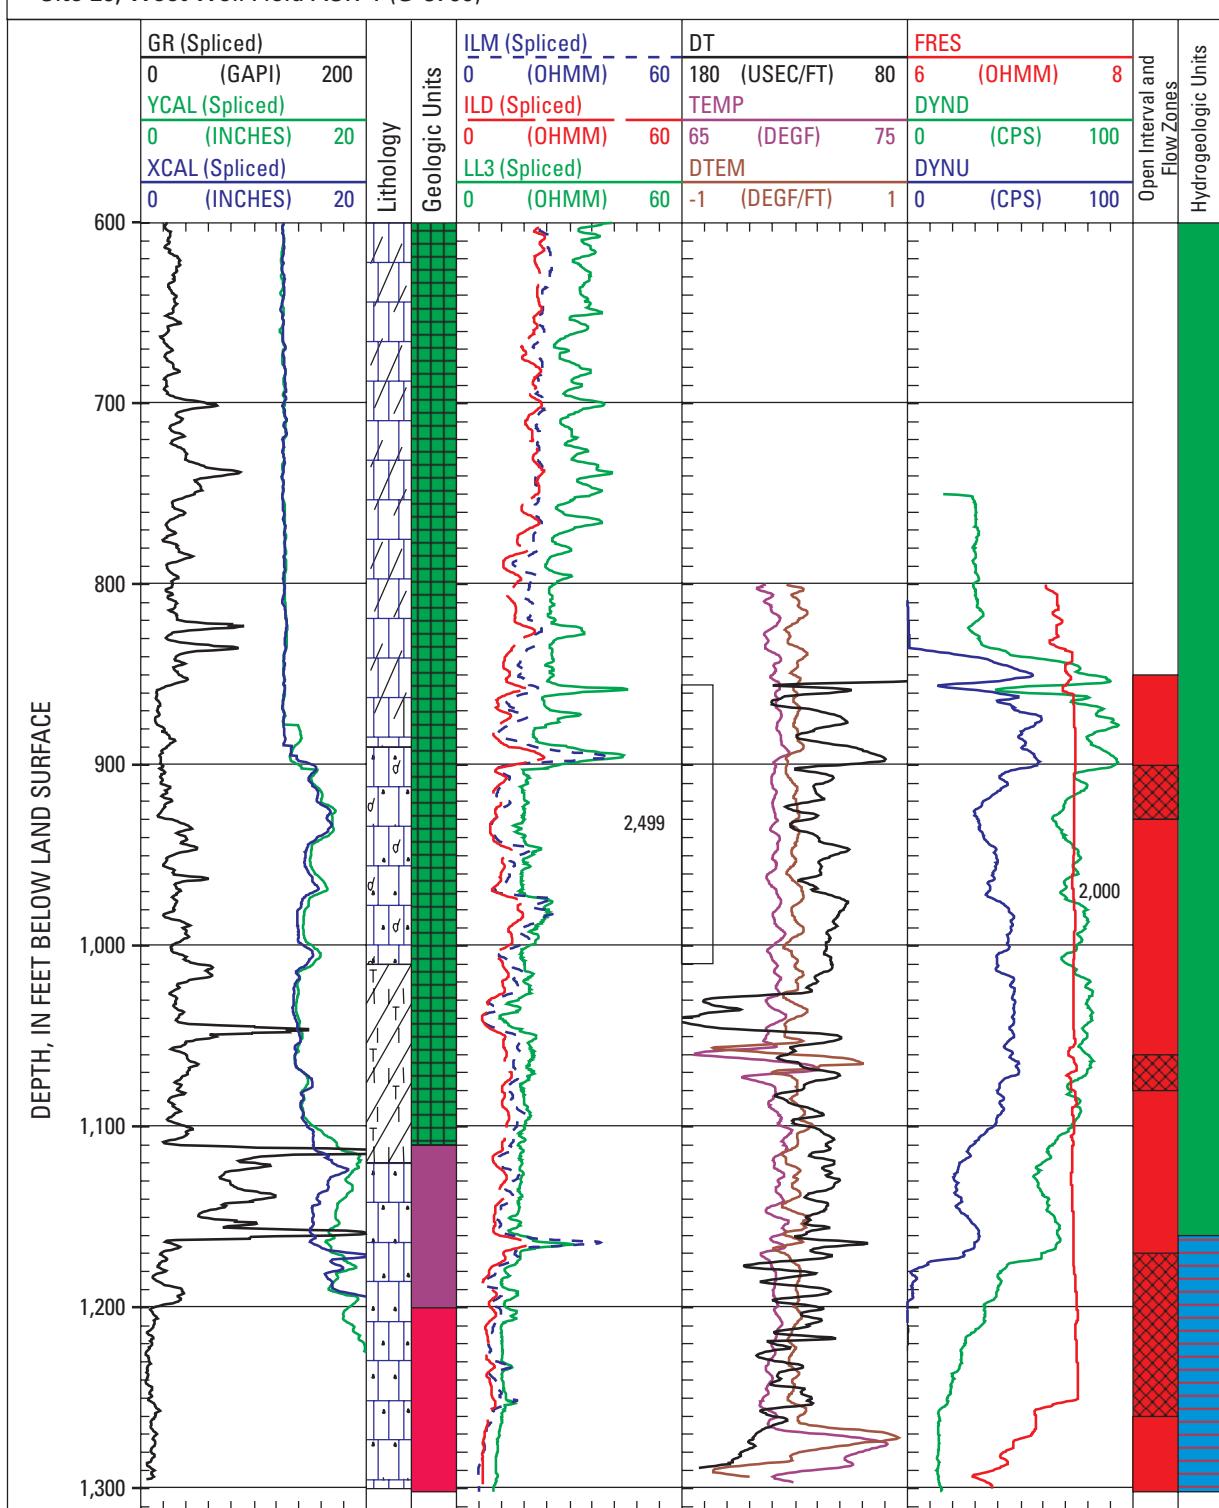

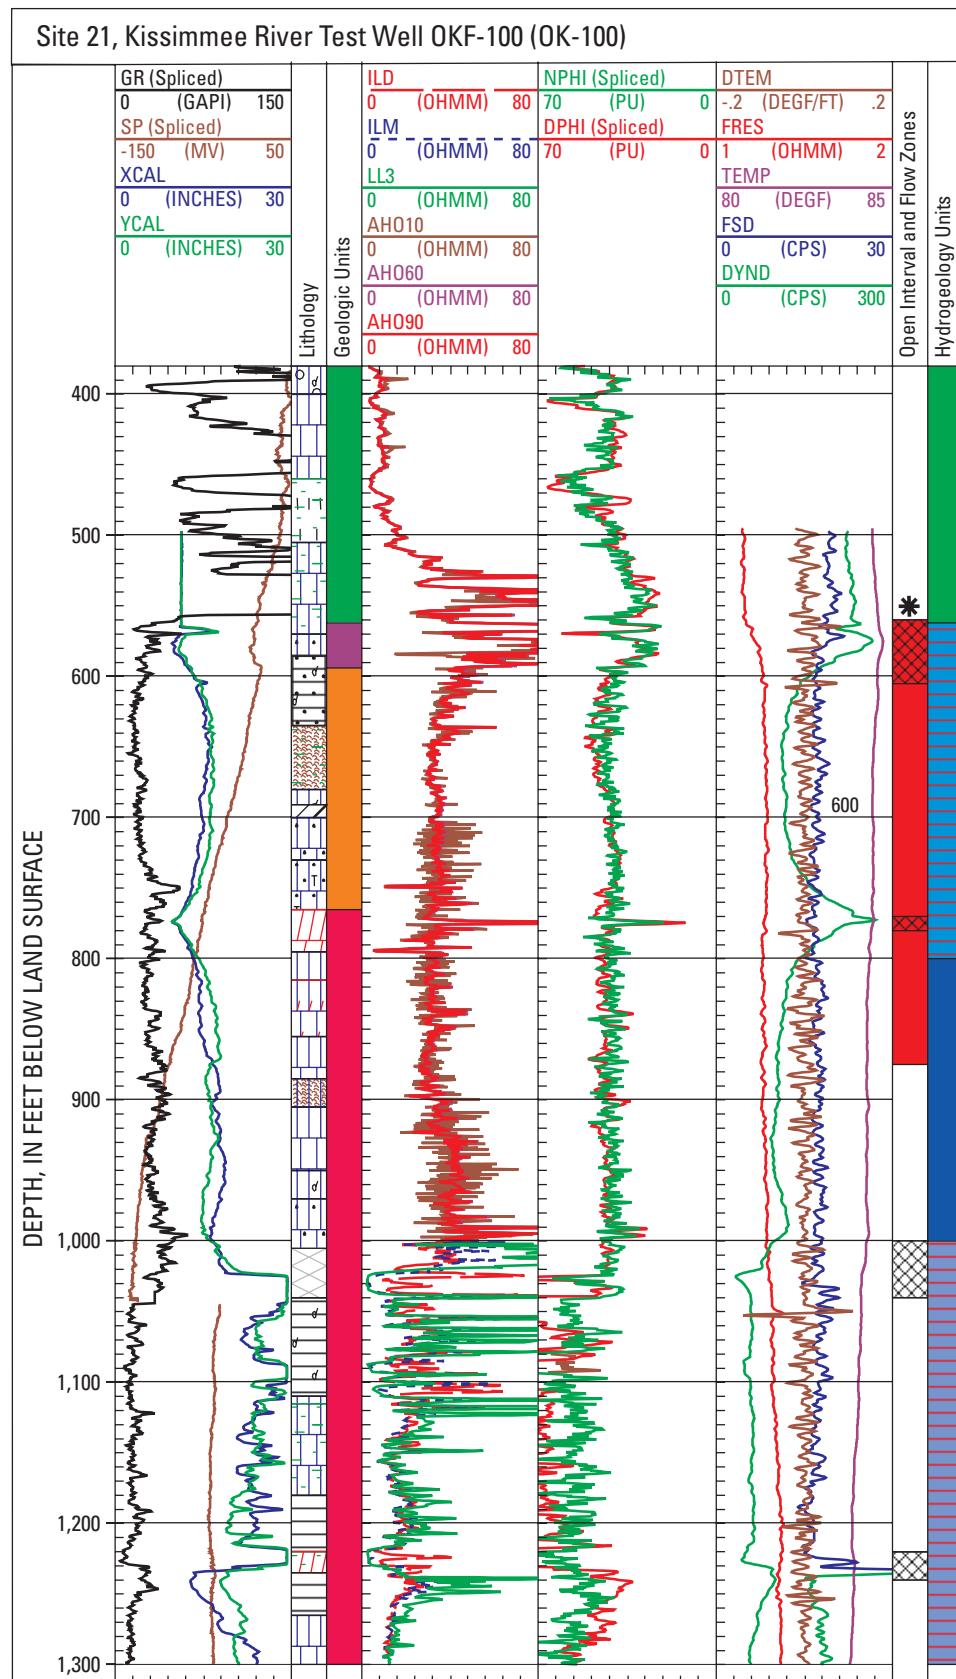

Site 18, J.R. Dean WTP EW-1 (G-3774)

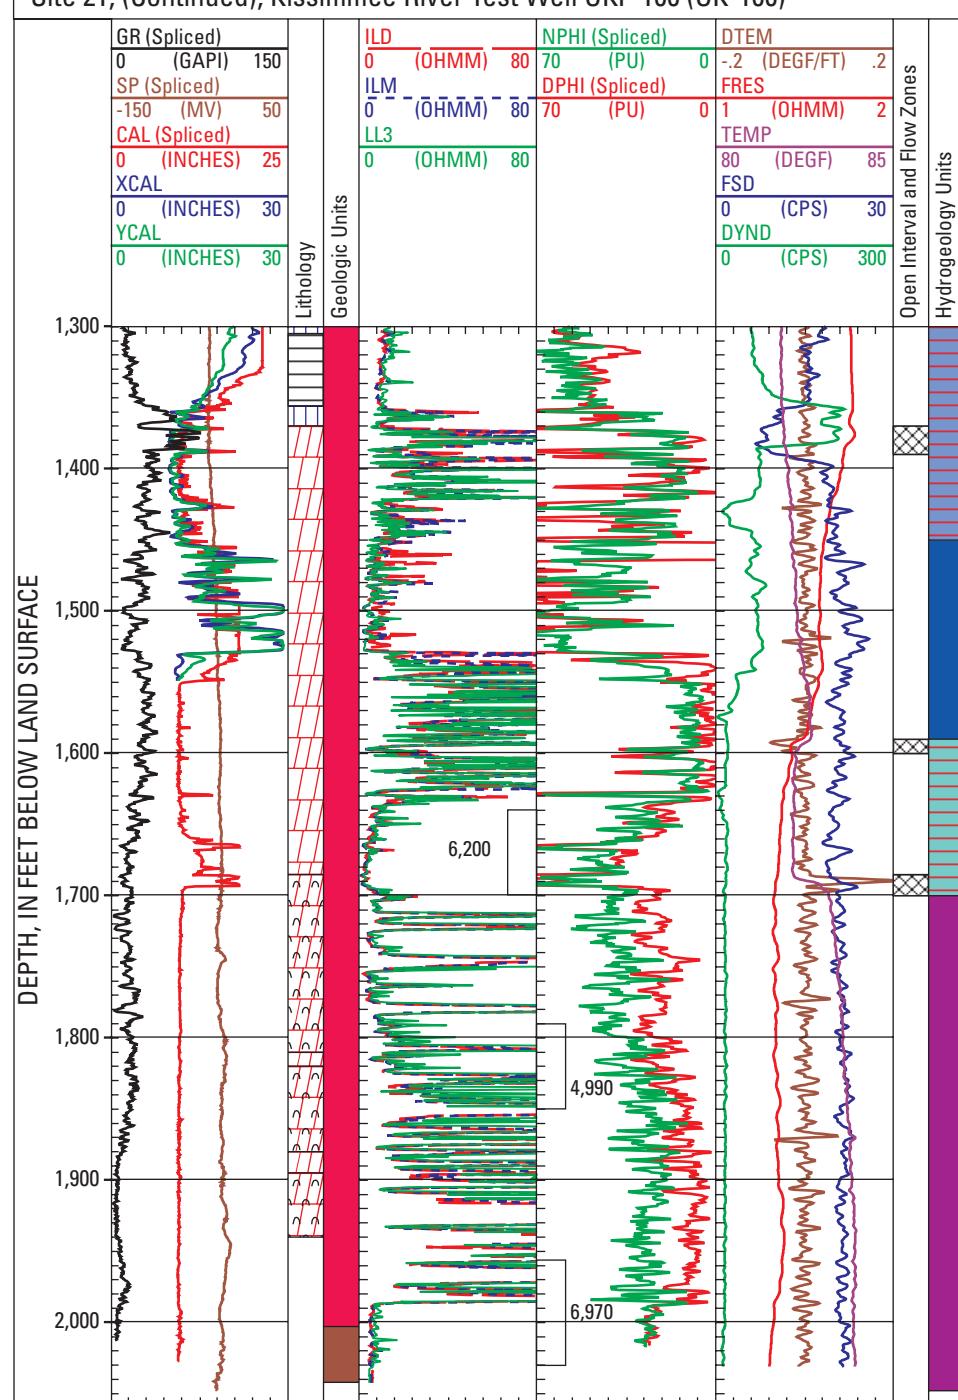

Site 20, West Well Field ASR-1 (G-3706)

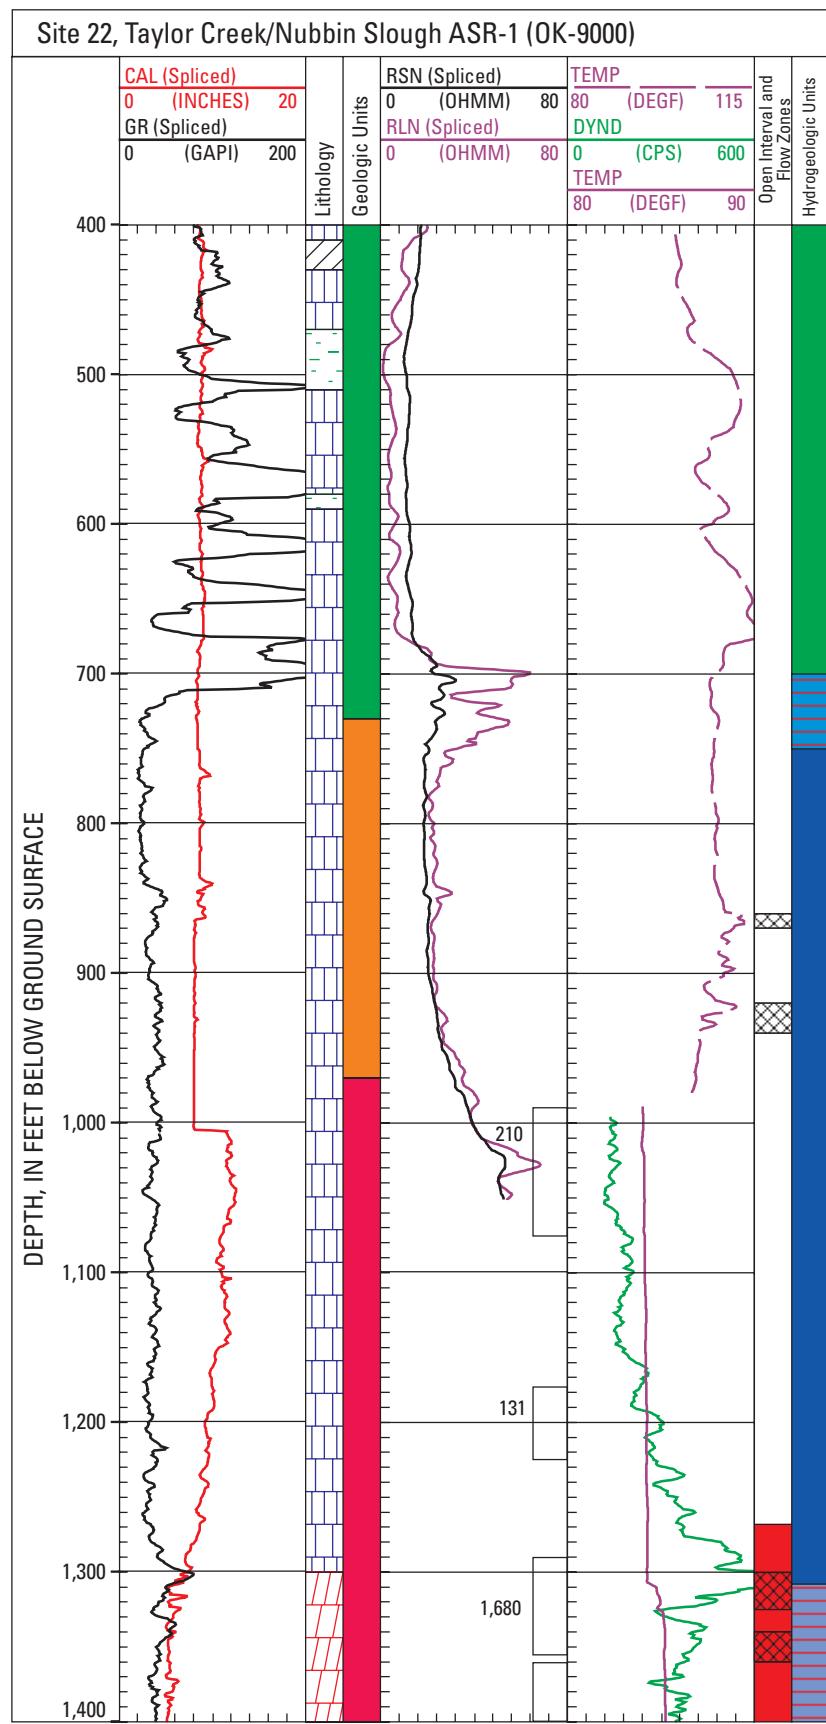

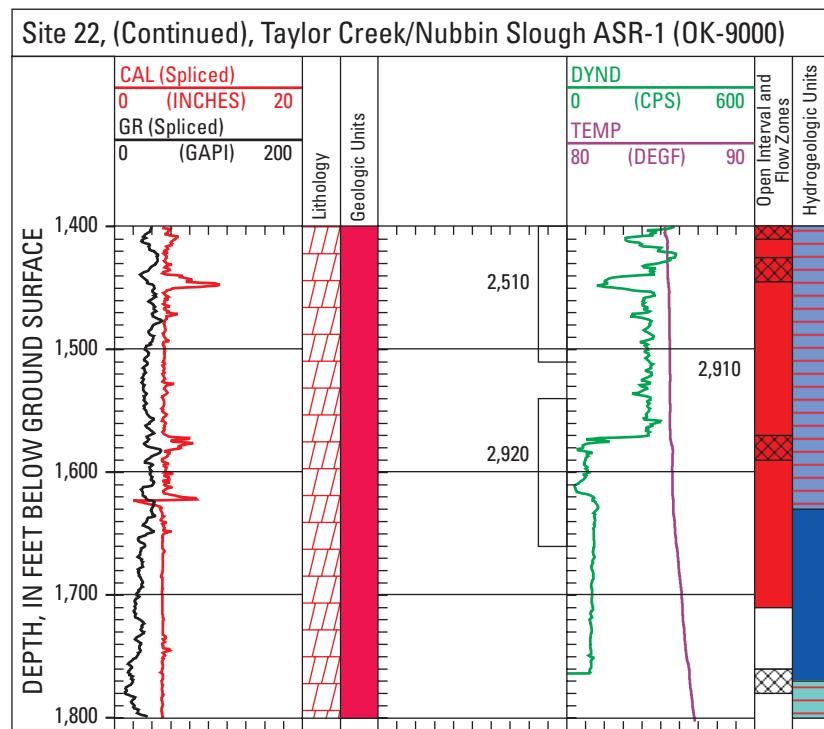

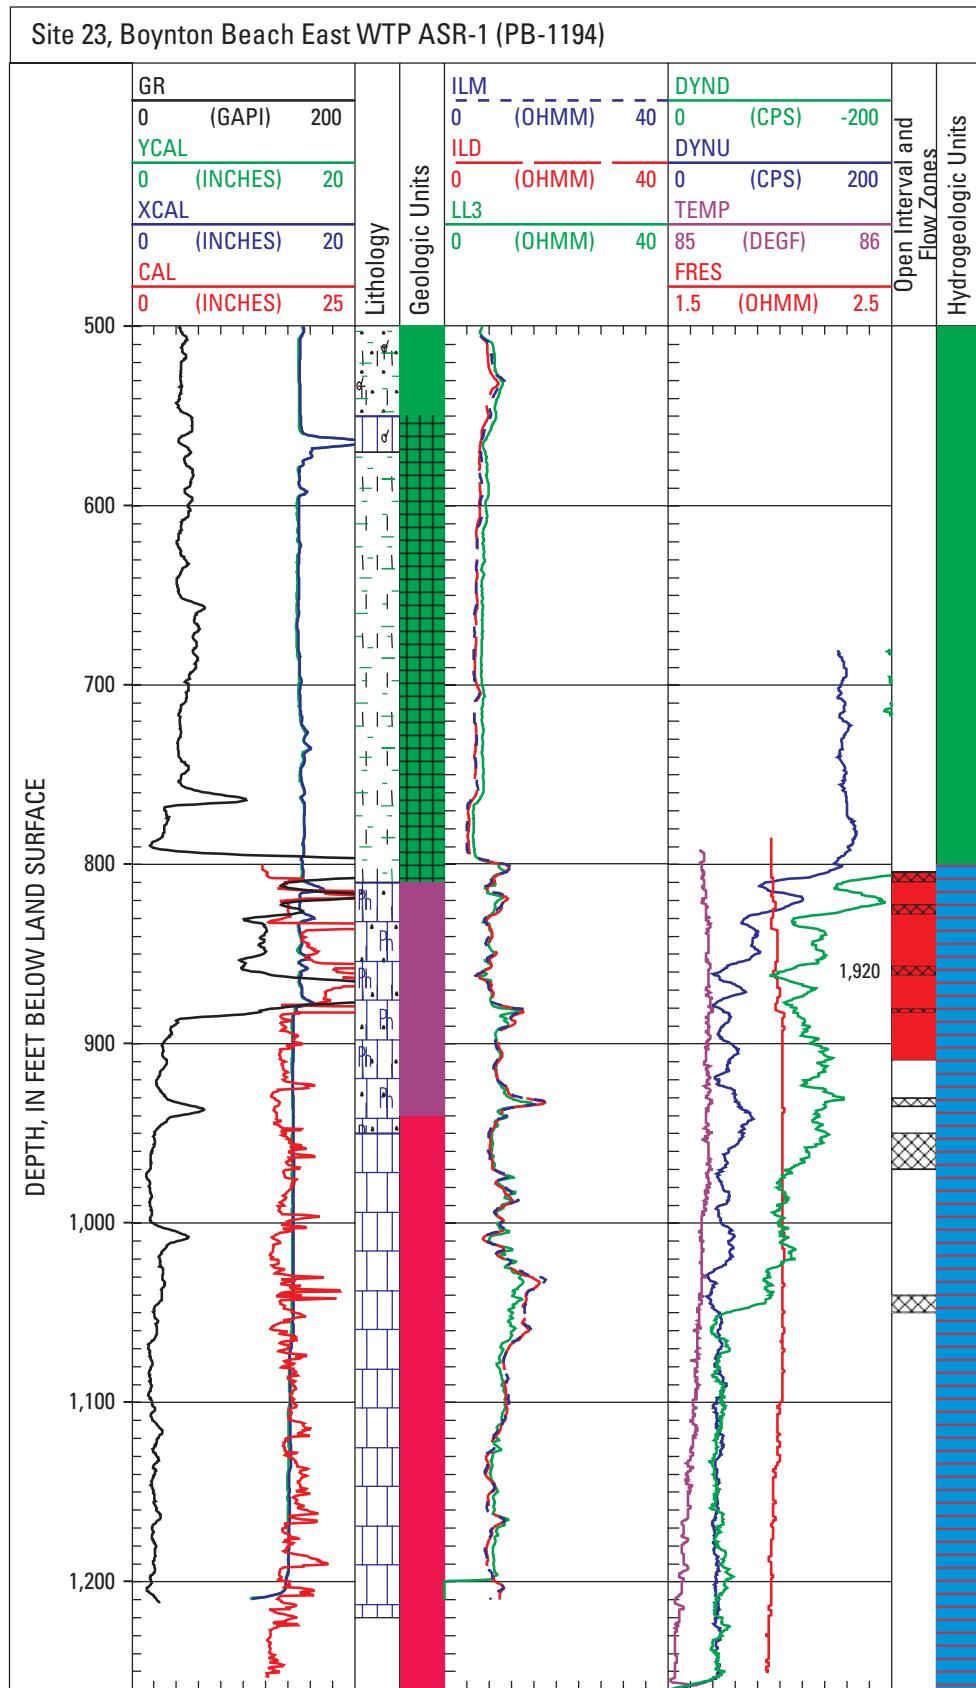

* Open interval is for well EXKR-1 (OK-101) at the same site. Well OKF-100 has not been completed, but casing was set at 565 feet.

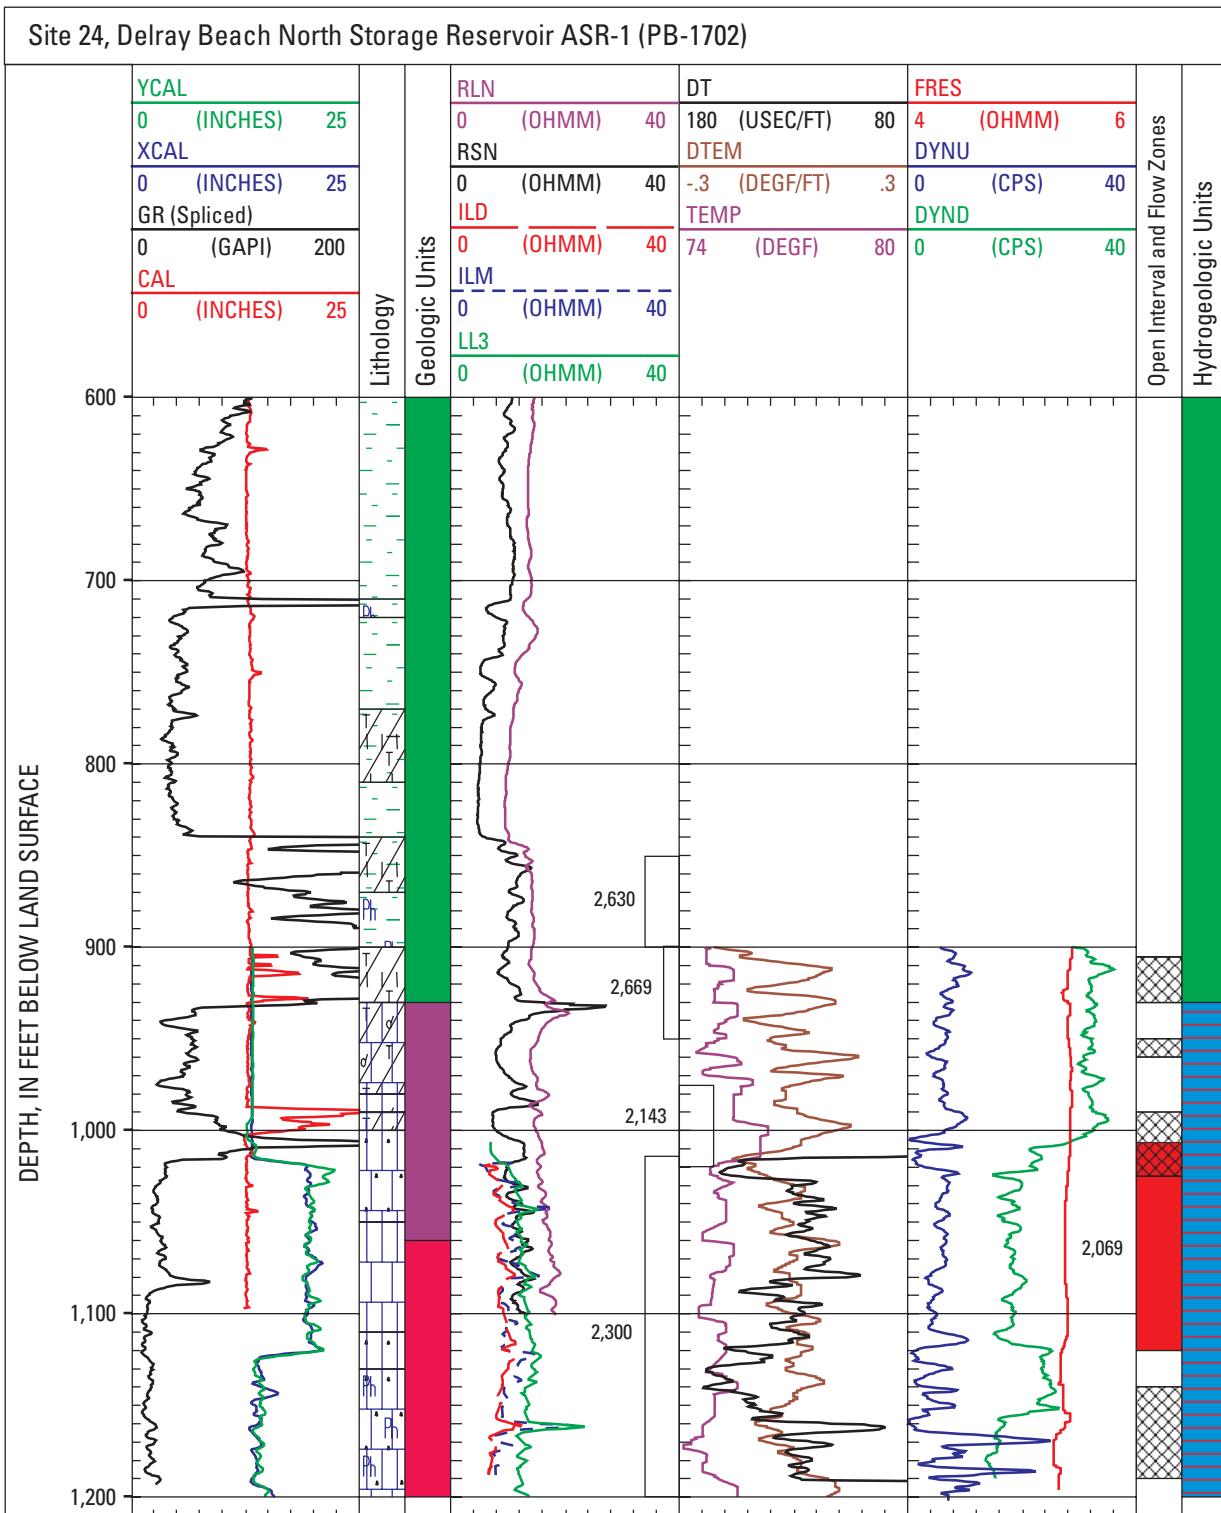

Site 21, (Continued), Kissimmee River Test Well OKF-100 (OK-100)
